# Free Theorems for Nested Types

# ANONYMOUS AUTHOR(S)

#### 1 INTRODUCTION

- Bob has forall types. But we have data types. So we each add somethign different to the simply typed lambda calculus. We'll treat simply typed lambda calculus with data types first, and may add poly types later. This will require additional hypotheses on the semantic categories.
- We're not (obviously) using the exponential between functor categories anywhere.
- Couldn't do this before LICS paper? Or could Bob have done it? What's new?

#### 1.1 Preliminaries

We write Set for the category of sets and functions.

DEFINITION 1. The category Rel is defined as follows.

- An object of Rel is a triple (A, B, R) where R is a relation between the objects A and B in Set, i.e., a subset of  $A \times B$ . We write R: Rel(A, B) when convenient.
- A morphism between objects R : Rel(A, B) and R' : Rel(A', B') of Rel is a pair  $(f : A \rightarrow A', g : B \rightarrow B')$  of morphisms in Set such that  $(f a, g b) \in R'$  whenever  $(a, b) \in R$ .

If R : Rel(A, B) we write  $\pi_1 R$  and  $\pi_2 R$  for the *domain* A of R and the *codomain* B of R, respectively. If A : Set, then we write  $Eq_A = (A, A, \{(x, x) \mid x \in A\})$  for the *equality relation* on A.

If C and D are categories, we write [C, D] for the set of  $\omega$ -cocontinuous functors from C to D.

#### 2 THE CALCULUS

## 2.1 Types

For each  $k \geq 0$ , we assume a countable set  $\mathbb{T}^k$  of type constructor variables of arity k, disjoint for distinct k. We use lower case Greek letters for type constructor variables, and write  $\phi^k$  to indicate that  $\phi \in \mathbb{T}^k$ . When convenient we may write  $\alpha, \beta$ , etc., rather than  $\alpha^0, \beta^0$ , etc., for elements of  $\mathbb{T}^0$ . The set of all type constructor variables is  $\mathbb{T} = \bigcup_{k \geq 0} \mathbb{T}^k$ . We further assume an infinite set  $\mathbb{V}$  of type variables disjoint from  $\mathbb{T}$ . We write  $\overline{\zeta}$  for either a set  $\{\zeta_1, ..., \zeta_n\}$  of type variables or a set of type constructor variables when the cardinality n of the set is unimportant. If  $\mathcal{P}$  is a set of type constructor variables then we write  $\mathcal{P}, \overline{\phi}$  for  $\mathcal{P} \cup \overline{\phi}$  when  $\mathcal{P} \cap \overline{\phi} = \emptyset$ . We omit the boldface for a singleton set, thus writing  $\phi$ , rather than  $\overline{\phi}$ , for  $\{\phi\}$ .

DEFINITION 2. Let V be a finite subset of  $\mathbb{V}$ , and let  $\mathcal{P}$  and  $\overline{\alpha}$  be finite subsets of  $\mathbb{T}$ . The sets  $\mathcal{T}(V)$  of type expressions over V and  $\mathcal{F}^{\mathcal{P}}(V)$  of type constructor expressions over V are given by:

$$\mathcal{T}(V) \; ::= \; V \mid \mathcal{T}(V) \to \mathcal{T}(V) \mid \forall v. \, \mathcal{T}(V,v) \mid \mathsf{Nat}^{\overline{\alpha}}(\mathcal{F}^{\overline{\alpha}}(V), \mathcal{F}^{\overline{\alpha}}(V))$$

and

$$\mathcal{F}^{\mathcal{P}}(V) ::= \mathcal{T}(V) \mid \mathbb{O} \mid \mathbb{1} \mid \mathcal{P}\overline{\mathcal{F}^{\mathcal{P}}(V)} \mid \mathcal{F}^{\mathcal{P}}(V) + \mathcal{F}^{\mathcal{P}}(V) \mid \mathcal{F}^{\mathcal{P}}(V) \times \mathcal{F}^{\mathcal{P}}(V)$$
$$\mid \left(\mu \phi^{k}.\lambda \alpha_{1}...\alpha_{k}.\mathcal{F}^{\mathcal{P},\alpha_{1},...,\alpha_{k},\phi}(V)\right) \overline{\mathcal{F}^{\mathcal{P}}(V)}$$

 The above notation entails that an application  $\tau\tau_1...\tau_k$  is allowed only when  $\tau$  is a type constructor variable of arity k, or  $\tau$  is a subexpression of the form  $\mu\phi^k.\lambda\alpha_1...\alpha_k.\tau$ . Moreover, if  $\tau$  has arity k then  $\tau$  must be applied to exactly k arguments. Accordingly, an overbar indicates a sequence of subexpressions whose length matches the arity of the functorial expression applied to it. The fact that functorial expressions are always in  $\eta$ -long normal form avoids having to consider  $\beta$ -conversion at the level of type constructors, and the fact that the standard type formers are all defined pointwise avoids having to relate functorial expressions at different kinds.

If  $\tau \in \mathcal{F}^{\mathcal{P}}(V)$ , if  $\mathcal{P}$  contains only type constructor variables of arity 0, and if k=0 for every occurrence of  $\phi^k$  bound by  $\mu$  in  $\tau$ , then we say that  $\tau$  is *first-order*. Otherwise we say that  $\tau$  is *second-order*. The intuition here is that variables in V can be substituted by any types, but those in  $\mathcal{P}$  can only be substituted by type constructors, even if of arity 0. In this case, they'd be substituted by type constructors of arity 0 - i.e., type constants - such as Nat or Bool.

DEFINITION 3. Let  $\Gamma$  be a type context, i.e., a finite set of type variables, and let  $\Phi$  be a type constructor context, i.e., a finite set of type constructor variables. The formation rules for the set  $\mathcal{T} \subseteq \bigcup_{V \subseteq \mathbb{V}} \mathcal{T}(V)$  of well-formed type expressions are

$$\frac{\Gamma, \upsilon; \emptyset \vdash \upsilon : \mathcal{T}}{\Gamma, \upsilon; \emptyset \vdash \upsilon : \mathcal{T}} \qquad \frac{\Gamma; \emptyset \vdash \sigma : \mathcal{T}}{\Gamma; \emptyset \vdash \sigma \to \tau : \mathcal{T}}$$

$$\frac{\Gamma, \upsilon; \emptyset \vdash \tau : \mathcal{T}}{\Gamma; \emptyset \vdash \forall \upsilon . \tau : \mathcal{T}} \qquad \frac{\Gamma; \overline{\alpha} \vdash \sigma : \mathcal{F}}{\Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} \sigma \tau : \mathcal{T}}$$

The formation rules for the set  $\mathcal{F} \subseteq \bigcup_{V \subseteq \mathbb{V}, \mathcal{P} \subseteq \mathbb{T}} \mathcal{F}^{\mathcal{P}}(V)$  of well-formed type constructor expressions are

$$\begin{array}{c|c} \Gamma;\emptyset \vdash \tau : \mathcal{T} \\ \hline \Gamma;\emptyset \vdash \tau : \mathcal{F} \end{array} & \hline \Gamma;\Phi,v \vdash v : \mathcal{F} \end{array} & \hline \Gamma;\Phi \vdash \emptyset : \mathcal{F} \end{array} & \hline \Gamma;\Phi \vdash 1 : \mathcal{F} \\ \hline \\ \underline{\Gamma;\Phi \vdash \phi^k : \mathcal{F}} & \overline{\Gamma;\Phi \vdash \tau : \mathcal{F}} \\ \hline \underline{\Gamma;\Phi \vdash \phi^k \overline{\tau}} \\ \underline{\Gamma;\Phi \vdash \phi^k \overline{\tau}} \\ \hline \underline{\Gamma;\Phi \vdash (\mu\phi^k.\lambda\overline{\alpha}.\tau)\overline{\tau}} \\ \hline \\ \underline{\Gamma;\Phi \vdash \sigma : \mathcal{F}} & \underline{\Gamma;\Phi \vdash \tau : \mathcal{F}} \\ \hline \Gamma;\Phi \vdash \sigma : \mathcal{F} & \underline{\Gamma;\Phi \vdash \tau : \mathcal{F}} \\ \hline \Gamma;\Phi \vdash \sigma : \mathcal{F} & \underline{\Gamma;\Phi \vdash \tau : \mathcal{F}} \end{array} & \underline{\Gamma;\Phi \vdash \sigma : \mathcal{F}} \\ \hline \Gamma;\Phi \vdash \sigma \times \tau : \mathcal{F} \end{array}$$

Our formation rules allow type constructor expressions like List  $\gamma = (\mu \beta. \lambda \alpha. \mathbb{1} + \alpha \times \beta) \gamma$  either to be natural in  $\gamma$  or not, according to whether it is well-formed in the context  $\emptyset$ ;  $\gamma$  or  $\gamma$ ;  $\emptyset$ . If the former, then we can derive  $\vdash \mathsf{Nat}^\gamma \mathbb{1}(\mathsf{List}\,\gamma) : \mathcal{T}$ . If the latter, then we cannot. Our formation rules also allow the derivation of, e.g.,  $\delta$ ;  $\emptyset \vdash \mathsf{Nat}^\gamma(\mathsf{List}\,\gamma)$  (Tree  $\gamma\delta$ ), which represents a natural transformation between lists and trees that is natural in  $\gamma$  but not in  $\delta$ .

Substitution for first-order type constructor expressions is the usual capture-avoiding textual substitution. We write  $\tau[\alpha := \sigma]$  for the result of substituting  $\sigma$  for  $\alpha$  in  $\tau$ , and  $\tau[\alpha_1 := \tau_1, ..., \alpha_k := \tau_k]$ , or  $\tau[\overline{\alpha} := \overline{\tau}]$  when convenient, for  $\tau[\alpha_1 := \tau_1][\alpha_2 := \tau_2, ..., \alpha_k := \tau_k]$ . Substitution for second-order type constructor expressions is given in the next definition.

DEFINITION 4. If  $\Gamma; \Phi, \phi^k \vdash h[\phi] : \mathcal{F}$  and  $\Gamma; \Phi, \overline{\alpha} \vdash F : \mathcal{F}$  with  $\overline{\alpha} = \{\alpha_1, ..., \alpha_k\}$  and  $k \ge 1$ , then  $\Gamma; \Phi \vdash h[\phi := F] : \mathcal{F}$ , where the operation  $(\cdot)[\phi := F]$  of second-order type constructor substitution

is defined by:

$$\begin{split} \tau[\phi := F] &= \tau \ if \ \tau \in \mathcal{T} \\ \mathbb{1}[\phi := F] &= \mathbb{1} \\ \mathbb{0}[\phi := F] &= \mathbb{0} \\ (\psi \overline{\tau})[\phi := F] &= \begin{cases} \psi \ \overline{\tau[\phi := F]} & if \ \psi \neq \phi \\ F[\alpha := \tau[\phi := F]] & if \ \psi = \phi \end{cases} \\ (\sigma + \tau)[\phi := F] &= \sigma[\phi := F] + \tau[\phi := F] \\ (\sigma \times \tau)[\phi := F] &= \sigma[\phi := F] \times \tau[\phi := F] \\ ((\mu \psi. \lambda \overline{\beta}. G) \overline{\tau}[\phi := F] &= (\mu \psi. \lambda \overline{\beta}. G[\phi := F]) \overline{\tau[\phi := F]} \end{split}$$

Note that, since an arity 0 type constructor is first-order, substitution into it is just the usual textual replacement, i.e., the usual notion of substitution, as expected.

#### 2.2 Terms

We assume an infinite set  $\mathcal V$  of term variables disjoint from  $\mathbb T$  and  $\mathbb V$ .

DEFINITION 5. Let  $\Gamma$  be a type context and  $\Phi$  be a type constructor context. A term context for  $\Gamma$  and  $\Phi$  is a finite set of bindings of the form  $x : \tau$ , where  $x \in V$  and  $\Gamma; \Phi \vdash \tau : \mathcal{F}$ .

We adopt the same conventions for denoting disjoint unions in term contexts as in type contexts and type constructor contexts.

Definition 6. Let  $\Delta$  be a term context for  $\Gamma$  and  $\Phi$ . The formation rules for the set of well-formed terms over  $\Delta$  are

1:4 Anon.

 $\frac{\Gamma;\emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} FG : \mathcal{T} \qquad \Gamma;\overline{\alpha} \mid \Delta, x : F \vdash t : G}{\Gamma;\emptyset \mid \Delta \vdash L_{\overline{\alpha}} x . t : \mathsf{Nat}^{\overline{\alpha}} FG}$ 152  $\frac{\Gamma;\emptyset \mid \Delta \vdash L_{\overline{\alpha}} x . t : \mathsf{Nat}^{\overline{\alpha}} FG}{\Gamma;\Phi \vdash \tau : \mathcal{F}} \qquad \Gamma;\Phi \mid \Delta \vdash s : F[\overline{\alpha} := \tau]$ 155  $\frac{\Gamma;\emptyset \mid \Delta \vdash t : \mathsf{Nat}^{\overline{\alpha}} FG}{\Gamma;\Phi \mid \Delta \vdash t : \mathsf{Nat}^{\overline{\alpha}} FG} \qquad \overline{\Gamma};\Phi \vdash \tau : \mathcal{F}$ 156  $\frac{\Gamma;\Phi \mid \Delta \vdash t : H[\phi := \mu\phi.\lambda\overline{\alpha}.H][\overline{\alpha} := \tau]}{\Gamma;\Phi \mid \Delta \vdash \mathsf{in}_{H} t : (\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}}$ 158  $\frac{\Gamma;\Phi \mid \Delta \vdash \mathsf{in}_{H} t : (\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}}{\Gamma;\Phi \vdash \tau}$ 160  $\frac{\Gamma;\overline{\alpha} \vdash F : \mathcal{F}}{\Gamma;\phi,\overline{\beta} \vdash H : \mathcal{F}} \qquad \Gamma;\emptyset \mid \Delta \vdash t : \mathsf{Nat}^{\overline{\alpha}} H[\phi := F][\overline{\beta} := \alpha]F$ 161  $\Gamma:\emptyset \mid \Delta \vdash \mathsf{fold}_{H} t : \mathsf{Nat}^{\overline{\alpha}} ((\mu\phi.\lambda\overline{\beta}.H)\overline{\alpha})F$ 

### 3 INTERPRETING TYPES

 Parametricity requires that set interpretations of types are defined concurrently with their relational interpretations. In this section we give the set interpretations for types; in the next section we give their relational interpretations. While the set interpretations are relatively straightforward, their relation interpretations are less so, mainly because of the cocontinuity conditions we must impose to ensure that they are well-behaved. We take some effort to develop these in Section 3.2, which separates Definitions 26 and 19 in space but otherwise has no impact on the fact that they are given by mutual induction.

#### 3.1 Interpreting Types as Sets

Definition 7. A set environment maps each type variable to a set, and each type constructor variable of arity k to an element of  $[\operatorname{Set}^k, \operatorname{Set}]$ . A morphism  $f: \rho \to \rho'$  from a set environment  $\rho$  to a set environment  $\rho'$  with  $\rho|_{\mathbb{V}} = \rho'|_{\mathbb{V}}$  maps each type variable v to  $\mathrm{id}_{\rho v}$ , and each type constructor variable  $\phi$  of arity k to a natural transformation from the k-ary functor  $\rho \phi$  on Set to the k-ary functor  $\rho' \phi$  on Set. Composition of morphisms on set environments is given componentwise, with the identity morphism mapping each set environment to itself. This gives a category of set environments and morphisms between them, which we denote SetEnv.

When convenient we identify a functor  $F:[\operatorname{Set}^0,\operatorname{Set}]$  with the set that is its codomain. With this convention, a set environment maps a type constructor variable of arity 0 to an  $\omega$ -cocontinuous functor from  $\operatorname{Set}^0$  to  $\operatorname{Set} - \operatorname{i.e.}$ , to a  $\operatorname{set} - \operatorname{just}$  as it does a type variable. If  $\overline{\alpha} = \{\alpha_1, ..., \alpha_k\}$  and  $\overline{A} = \{A_1, ..., A_k\}$ , then we write  $\rho[\overline{\alpha} := A]$  for the set environment  $\rho'$  such that  $\rho'\alpha_i = A_i$  for i = 1, ..., k and  $\rho'\alpha = \rho\alpha$  if  $\alpha \notin \{\alpha_1, ..., \alpha_k\}$ .

If  $\rho$  is a set environment we write Eq $_{\rho}$  for the relation environment such that Eq $_{\rho}v={\rm Eq}_{\rho v}$  for every type variable or type constructor variable v; see Definition 17 below for the complete definition of a relation environment. The relational interpretations referred to in the condition on the natural transformations in the clause of Definition 26 for types of the form Nat $^{\overline{\alpha}}$  F G are given in full in Definition 19. Intuitively, this condition can be thought of as ensuring that set interpretations of such terms are sufficiently uniform.

DEFINITION 8. Let  $\rho$  be a set environment. The set interpretation  $[\![\cdot]\!]^{Set} : \mathcal{F} \to [SetEnv, Set]$  is defined by

If  $\rho$  is a set environment and  $\vdash \tau : \mathcal{F}$  then we may write  $\llbracket \vdash \tau \rrbracket^{\mathsf{Set}}$  instead of  $\llbracket \emptyset ; \emptyset \vdash \tau \rrbracket^{\mathsf{Set}} \rho$  since the environment is immaterial. Definition 26 ensures that

and  $T_{\rho}^{\text{Set}} \eta = \lambda \overline{A}. [\Gamma; \Phi, \phi, \overline{\alpha} \vdash H]^{\text{Set}} id_{\rho} [\phi := \eta] [\overline{\alpha := id_A}]$ 

$$\llbracket \Gamma; \Phi \vdash F\overline{\tau} \rrbracket^{\mathsf{Set}} \rho = \llbracket \Gamma; \Phi, \overline{\alpha} \vdash F\overline{\alpha} \rrbracket^{\mathsf{Set}} (\rho [\overline{\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}}}])$$

Moreover, the third fourth clause does indeed define a set. Indeed, local finite presentability of Set and  $\omega$ -cocontinuity of  $\llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\operatorname{Set}} \rho$  ensure that  $\{\eta : \llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\operatorname{Set}} \rho \Rightarrow \llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\operatorname{Set}} \rho \}$  (which contains  $\llbracket \Gamma; \emptyset \vdash \operatorname{Nat}^{\overline{\alpha}} F G \rrbracket^{\operatorname{Set}} \rho$ ) is a subset of

$$\left\{(\llbracket\Gamma;\overline{\alpha}\vdash G\rrbracket^{\mathsf{Set}}\rho[\overline{\alpha:=S}])^{(\llbracket\Gamma;\overline{\alpha}\vdash F\rrbracket^{\mathsf{Set}}\rho[\overline{\alpha:=S}])}\;\middle|\;\overline{S}=(S_1,...,S_{|\overline{\alpha}|}),\;\text{and}\;S_i\;\text{is a finite set for}\;i=1,...,|\overline{\alpha}|\right\}$$

There are countably many choices for tuples  $\overline{S}$ , and each of these gives rise to a morphism from  $[\![\Gamma; \overline{\alpha} \vdash F]\!]^{\operatorname{Set}} \rho[\overline{\alpha} := S]$  to  $[\![\Gamma; \overline{\alpha} \vdash G]\!]^{\operatorname{Set}} \rho[\overline{\alpha} := S]$ . But there are only Set-many choices of morphisms between these (or any) two objects because Set is locally small.

In order to make sense of the last clause in Definition 26, we need to know that  $T_{\rho}^{\rm Set}$  is an  $\omega$ -cocontinuous endofunctor on [Set<sup>k</sup>, Set], so that it admits a fixed point. Since  $T_{\rho}^{\rm Set}$  is defined in terms of  $[\Gamma; \Phi, \phi, \overline{\alpha} \vdash H]^{\rm Set}$ , this means that set interpretations of types must be functors. This in turn means that the actions of set interpretations of types on objects and on morphisms in SetEnv are intertwined. In fact, we know from [Johann and Polonsky 2019] that, for every  $\Gamma; \overline{\alpha} \vdash \tau : \mathcal{F}$ ,  $[\Gamma; \overline{\alpha} \vdash \tau]^{\rm Set}$  is actually functorial in  $\overline{\alpha}$  and  $\omega$ -cocontinuous. What remains is to define the actions of each of these functors on morphisms between environments.

DEFINITION 9. Let  $f: \rho \to \rho'$  for set environments  $\rho$  and  $\rho'$  such that  $\rho|_{\mathbb{V}} = \rho'|_{\mathbb{V}}$ . The action  $[\![\Gamma; \Phi \vdash \tau]\!]^{\text{Set}}$  of  $[\![\Gamma; \Phi \vdash \tau]\!]^{\text{Set}}$  on the morphism f is given as follows:

- If  $\Gamma, v; \emptyset \vdash v \text{ then } \llbracket \Gamma, v; \emptyset \vdash v \rrbracket^{\mathsf{Set}} f = id_{\rho v}.$
- If  $\Gamma$ ;  $\emptyset \vdash \sigma \to \tau$  then  $[\![\Gamma; \emptyset \vdash \sigma \to \tau]\!]^{\operatorname{Set}} f = id_{[\![\Gamma; \emptyset \vdash \sigma \to \tau]\!]^{\operatorname{Set}} \rho}$ .
- $\bullet \ \, If \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} \, F \, G, \, then \, \, we \, define \, [\![\Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} \, F \, G]\!]^{\mathsf{Set}} f = id_{[\![\Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} \, F \, G]\!]^{\mathsf{Set}} \rho}.$

1:6 Anon.

- If  $\Gamma$ ;  $\Phi \vdash \mathbb{O}$  then  $\llbracket \Gamma; \Phi \vdash \mathbb{O} \rrbracket^{\mathsf{Set}} f = id_0$ .
- If  $\Gamma$ ;  $\Phi \vdash \mathbb{1}$  then  $\llbracket \Gamma; \Phi \vdash \mathbb{1} \rrbracket^{\text{Set}} f = id_1$ .
- If  $\Gamma; \Phi \vdash \phi \overline{\tau}$ , then we have that  $\llbracket \Gamma; \Phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Set}} f : \llbracket \Gamma; \Phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Set}} \rho \to \llbracket \Gamma; \Phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Set}} \rho' = (\rho \phi) \overline{\llbracket \Gamma; \Phi \vdash \tau} \overline{\rrbracket^{\operatorname{Set}}} \rho \to (\rho' \phi) \overline{\llbracket \Gamma; \Phi \vdash \tau} \overline{\rrbracket^{\operatorname{Set}}} \rho'$  is defined by  $\llbracket \Gamma; \Phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Set}} f = (f \phi) \overline{\llbracket \Gamma; \Phi \vdash \tau} \overline{\rrbracket^{\operatorname{Set}}} \rho'$  of  $(\rho \phi) \overline{\llbracket \Gamma; \Phi \vdash \tau} \overline{\rrbracket^{\operatorname{Set}}} f = (\rho' \phi) \overline{\llbracket \Gamma; \Phi \vdash \tau} \overline{\rrbracket^{\operatorname{Set}}} f \circ (f \phi) \overline{\llbracket \Gamma; \Phi \vdash \tau} \overline{\rrbracket^{\operatorname{Set}}} \rho'$ . This equality holds because  $\rho \phi$  and  $\rho' \phi$  are functors and  $f \phi : \rho \phi \to \rho' \phi$  is a natural transformation, so that the following naturality square commutes:

$$(\rho\phi)\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}\rho} \xrightarrow{(f\phi)_{\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}\rho}}} (\rho'\phi)\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}\rho}$$

$$(\rho\phi)\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}f} \downarrow \qquad \qquad (\rho'\phi)\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}f} \downarrow \qquad (1)$$

$$(\rho\phi)\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}\rho'} \xrightarrow{(f\phi)_{\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}\rho'}}} (\rho'\phi)\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\operatorname{Set}}\rho'}$$

- If  $\Gamma$ ;  $\Phi \vdash \sigma + \tau$  then  $\llbracket \Gamma$ ;  $\Phi \vdash \sigma + \tau \rrbracket^{\operatorname{Set}} f$  is defined by  $\llbracket \Gamma$ ;  $\Phi \vdash \sigma + \tau \rrbracket^{\operatorname{Set}} f(\operatorname{inl} x) = \operatorname{inl} (\llbracket \Gamma; \Phi \vdash \sigma \rrbracket^{\operatorname{Set}} f x)$  and  $\llbracket \Gamma; \Phi \vdash \sigma + \tau \rrbracket^{\operatorname{Set}} f(\operatorname{inr} y) = \operatorname{inr} (\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}} f y)$ .
- If  $\Gamma$ ;  $\Phi \vdash \sigma \times \tau$  then  $[\![\Gamma; \Phi \vdash \sigma \times \tau]\!]^{\operatorname{Set}} f = [\![\Gamma; \Phi \vdash \sigma]\!]^{\operatorname{Set}} f \times [\![\Gamma; \Phi \vdash \tau]\!]^{\operatorname{Set}} f$ .
- If  $\Gamma$ ;  $\Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau}$  then letting  $\sigma_f^{\text{Set}} : T_{\rho}^{\text{Set}} \to T_{\rho'}^{\text{Set}}$  be the map

$$F \mapsto \lambda \overline{A}. \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket \rrbracket^{\mathsf{Set}} f [\phi := id_F] [\overline{\alpha := id_A}]$$

we define

$$\begin{split} & [\![\Gamma;\Phi \vdash (\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}]\!]^{\operatorname{Set}}f \\ & : \quad [\![\Gamma;\Phi \vdash (\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}]\!]^{\operatorname{Set}}\rho \, \to \, [\![\Gamma;\Phi \vdash (\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}]\!]^{\operatorname{Set}}\rho' \\ & = \quad (\mu T_{\rho}^{\operatorname{Set}})\overline{[\![\Gamma;\Phi \vdash \tau]\!]^{\operatorname{Set}}\rho} \, \to \, (\mu T_{\rho'}^{\operatorname{Set}})\overline{[\![\Gamma;\Phi \vdash \tau]\!]^{\operatorname{Set}}\rho'} \end{split}$$

by

$$\begin{split} &(\mu\sigma_f^{\mathsf{Set}})\overline{[\![\Gamma;\Phi\vdash\tau]\!]^{\mathsf{Set}}\rho'}\circ(\mu T_\rho^{\mathsf{Set}})\overline{[\![\Gamma;\Phi\vdash\tau]\!]^{\mathsf{Set}}f}\\ &=&(\mu T_{\rho'}^{\mathsf{Set}})\overline{[\![\Gamma;\Phi\vdash\tau]\!]^{\mathsf{Set}}f}\circ(\mu\sigma_f^{\mathsf{Set}})\overline{[\![\Gamma;\Phi\vdash\tau]\!]^{\mathsf{Set}}\rho} \end{split}$$

Again, this equality holds because  $\mu T_{\rho}^{\text{Set}}$  and  $\mu T_{\rho'}^{\text{Set}}$  are functors and  $\mu \sigma_f^{\text{Set}}: \mu T_{\rho}^{\text{Set}} \to \mu T_{\rho'}^{\text{Set}}$  is a natural transformation, so that the following naturality square commutes:

$$(\mu T_{\rho}^{\mathsf{Set}}) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho} \xrightarrow{(\mu \sigma_{f}^{\mathsf{Set}})_{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho}} (\mu T_{\rho'}^{\mathsf{Set}}) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho}$$

$$(\mu T_{\rho}^{\mathsf{Set}}) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} f} \downarrow$$

$$(\mu T_{\rho}^{\mathsf{Set}}) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho'} \xrightarrow{(\mu \sigma_{f}^{\mathsf{Set}})_{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho'}} (\mu T_{\rho'}^{\mathsf{Set}}) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho'}$$

$$(2)$$

## 3.2 Interpreting Types as Relations

DEFINITION 10. A k-ary relation transformer F is a triple  $(F^0, F^1, F^*)$ , where  $F^0, F^1 : [\operatorname{Set}^k, \operatorname{Set}]$  are functors,  $F^* : [\operatorname{Rel}^k, \operatorname{Rel}]$  is a functor, if  $R_1 : \operatorname{Rel}(A_1, B_1), ..., R_k : \operatorname{Rel}(A_k, B_k)$ , then  $F^*\overline{R} : \operatorname{Rel}(F^0\overline{A}, F^1\overline{B})$ , and if  $(\alpha_1, \beta_1) \in \operatorname{Hom}_{\operatorname{Rel}}(R_1, S_1), ..., (\alpha_k, \beta_k) \in \operatorname{Hom}_{\operatorname{Rel}}(R_k, S_k)$  then  $F^*\overline{(\alpha, \beta)} = (F^0\overline{\alpha}, F^1\overline{\beta})$ . We define  $F\overline{R}$  to be  $F^*\overline{R}$  and  $F(\alpha, \beta)$  to be  $F^*(\alpha, \beta)$ .

Expanding the last clause of Definition 10 is equivalent to: if  $\overline{(a,b)} \in R$  implies  $\overline{(\alpha a,\beta b)} \in S$  then  $(c,d) \in F^*\overline{R}$  implies  $(F^0\overline{\alpha} c,F^1\overline{\beta} d) \in F^*\overline{S}$ .

335

336

337 338

339

340

341

342 343 When convenient we identify a 0-ary relation transformer (A, B, R) with R : Rel(A, B). We may also write  $F^0$  and  $F^1$  for  $\pi_1 F$  and  $\pi_2 F$ . We extend these conventions to relation environments, introduced in Definition 17 below, as well.

Definition 11. The category  $RT_k$  of k-ary relation transformers is given by the following data:

- An object of  $RT_k$  is a relation transformer.
- A morphism  $\delta: (G^0, G^1, G^*) \to (H^0, H^1, H^*)$  in  $RT_k$  is a pair of natural transformations  $(\delta^0, \delta^1)$  where  $\delta^0: G^0 \to H^0$ ,  $\delta^1: G^1 \to H^1$  such that, for all  $\overline{R}: Rel(A, B)$ , if  $(x, y) \in G^*\overline{R}$  then  $(\delta^0_A x, \delta^1_B y) \in H^*\overline{R}$ . This is basically a fibred natural transformation, but for heterogeneous relations.
- Identity morphisms and composition are inherited from the category of functors on Set.

DEFINITION 12. An endofunctor H on  $RT_k$  is a triple  $H = (H^0, H^1, H^*)$ , where

- $H^0$  and  $H^1$  are functors from [Set<sup>k</sup>, Set] to [Set<sup>k</sup>, Set]
- $H^*$  is a functor from  $RT_k$  to  $[Rel^k, Rel]$
- for all  $\overline{R}$ : Rel(A,B),  $\pi_1((H^*(\delta^0,\delta^1))_{\overline{R}}) = (H^0\delta^0)_{\overline{A}}$  and  $\pi_2((H^*(\delta^0,\delta^1))_{\overline{R}}) = (H^1\delta^1)_{\overline{R}}$
- The action of H on objects is given by  $H(F^0, F^1, F^*) = (H^0F^0, H^1F^1, H^*(F^0, F^1, F^*))$
- The action of H on morphisms is given by  $H(\delta^0, \delta^1) = (H^0 \delta^0, H^1 \delta^1)$  for  $(\delta^0, \delta^1) : (F^0, F^1, F^*) \rightarrow (G^0, G^1, G^*)$

Since the results of applying H to k-ary relation transformers and morphisms between them must again be k-ary relation transformers and morphisms between them, respectively, Definition 12 implicitly requires that the following three conditions hold:

(1) if  $R_1 : Rel(A_1, B_1), ..., R_k : Rel(A_k, B_k)$ , then

$$H^*(F^0, F^1, F^*)\overline{R} : \mathsf{Rel}(H^0F^0\overline{A}, H^1F^1\overline{B})$$

In other words,  $\pi_1(H^*(F^0, F^1, F^*)\overline{R}) = H^0F^0\overline{A}$  and  $\pi_2(H^*(F^0, F^1, F^*)\overline{R}) = H^1F^1\overline{B}$ .

(2) if  $(\alpha_1, \beta_1) \in \text{Hom}_{\text{Rel}}(R_1, S_1), ..., (\alpha_k, \beta_k) \in \text{Hom}_{\text{Rel}}(R_k, S_k)$ , then

$$H^*(F^0,F^1,F^*)\overline{(\alpha,\beta)}=(H^0F^0\overline{\alpha},H^1F^1\overline{\beta})$$

In other words,  $\pi_1(H^*(F^0, F^1, F^*)\overline{(\alpha, \beta)}) = H^0F^0\overline{\alpha}$  and  $\pi_2(H^*(F^0, F^1, F^*)\overline{(\alpha, \beta)}) = H^1F^1\overline{\beta}$ .

(3) if  $(\delta^0, \delta^1): (F^0, F^1, F^*) \to (G^0, G^1, G^*)$  and  $R_1: \text{Rel}(A_1, B_1), ..., R_k: \text{Rel}(A_k, B_k)$ , then

if 
$$(x,y) \in H^*(F^0,F^1,F^*)\overline{R}$$
 then  $((H^0\delta^0)_{\overline{A}}x,(H^1\delta^1)_{\overline{B}}y) \in H^*(G^0,G^1,G^*)\overline{R}$ 

Note, however, that this condition is automatically satisfied because it is implied by the third bullet point of Definition 12.

DEFINITION 13. If H and K are endofunctors on  $RT_k$ , then a natural transformation  $\sigma: H \to K$  is a pair  $\sigma = (\sigma^0, \sigma^1)$ , where  $\sigma^0: H^0 \to K^0$  and  $\sigma^1: H^1 \to K^1$  are natural transformations between endofunctors on [Set<sup>k</sup>, Set] and the component of  $\sigma$  at the k-ary relation transformer F is given by  $\sigma_F = (\sigma^0_{F^0}, \sigma^1_{F^1})$ .

Definition 13 entails that  $\sigma^i_{F^i}$  must be natural in  $F^i$ : [Set<sup>k</sup>, Set], and, for every F, both  $(\sigma^0_{F^0})_{\overline{A}}$  and  $(\sigma^1_{F^1})_{\overline{A}}$  must be natural in  $\overline{A}$ . Moreover, since the results of applying  $\sigma$  to k-ary relation transformers must be morphisms of k-ary relation transformers, Definition 13 implicitly requires that  $(\sigma_F)_{\overline{R}} = ((\sigma^0_{F^0})_{\overline{A}}, (\sigma^1_{F^1})_{\overline{B}})$  is a morphism in Rel for any k-tuple of relations  $\overline{R} : \overline{Rel(A,B)}$ , i.e., if  $(x,y) \in H^*F\overline{R}$ , then  $((\sigma^0_{F^0})_{\overline{A}}x, (\sigma^1_{F^1})_{\overline{B}}y) \in K^*F\overline{R}$ .

Next, we see that we can compute colimits in  $RT_k$ .

1:8 Anon.

LEMMA 14.  $\lim_{d \in \mathcal{D}} (F_d^0, F_d^1, F_d^*) = (\lim_{d \in \mathcal{D}} F_d^0, \lim_{d \in \mathcal{D}} F_d^1, \lim_{d \in \mathcal{D}} F_d^1)$ 

PROOF. We first observe that  $(\varinjlim_{d \in \mathcal{D}} F_d^0, \varinjlim_{d \in \mathcal{D}} F_d^1, \varinjlim_{d \in \mathcal{D}} F_d^*)$  is in  $RT_k$ . If  $R_1 : \operatorname{Rel}(A_1, B_1), ..., R_k : \operatorname{Rel}(A_k, B_k)$ , then  $\varinjlim_{d \in \mathcal{D}} F_d^*\overline{R} : \operatorname{Rel}(\varinjlim_{d \in \mathcal{D}} F_d^0\overline{A}, \varinjlim_{d \in \mathcal{D}} F_d^1\overline{B})$  because of how colimits are computed in Rel. Moreover, if  $(\alpha_1, \beta_1) \in \operatorname{Hom}_{\operatorname{Rel}}(R_1, S_1), ..., (\alpha_k, \beta_k) \in \operatorname{Hom}_{\operatorname{Rel}}(R_k, S_k)$ , then

$$\begin{array}{ll} & (\varinjlim_{d \in \mathcal{D}} F_d^*) \overline{(\alpha,\beta)} \\ = & \varinjlim_{d \in \mathcal{D}} F_d^* \overline{(\alpha,\beta)} \\ = & \varinjlim_{d \in \mathcal{D}} (F_d^0 \overline{\alpha}, F_d^1 \overline{\beta}) \\ = & (\varinjlim_{d \in \mathcal{D}} F_d^0 \overline{\alpha}, \varinjlim_{d \in \mathcal{D}} F_d^1 \overline{\beta}) \end{array}$$

so  $(\varinjlim_{d \in \mathcal{D}} F_d^0, \varinjlim_{d \in \mathcal{D}} F_d^1, \varinjlim_{d \in \mathcal{D}} F_d^1)$  actually is in  $RT_k$ . Now to see that  $\varinjlim_{d \in \mathcal{D}} (F_d^0, F_d^1, F_d^*) = (\varinjlim_{d \in \mathcal{D}} F_d^0, \varinjlim_{d \in \mathcal{D}} F_d^1, \varinjlim_{d \in \mathcal{D}} F_d^*)$ , let  $\gamma_d^0 : F_d^0 \to \varinjlim_{d \in \mathcal{D}} F_d^0$  and  $\gamma_d^1 : F_d^1 \to \varinjlim_{d \in \mathcal{D}} F_d^1$  be the injections for the colimits  $\varinjlim_{d \in \mathcal{D}} F_d^0$  and  $\varinjlim_{d \in \mathcal{D}} F_d^1$ , respectively. Then  $(\gamma_d^0, \gamma_d^1): (F_d^0, F_d^1, F_d^*) \to \varinjlim_{d \in \underline{\mathcal{D}}} (F_d^0, F_d^1, F_d^*)$  is a morphism in  $RT_k$  because, for all R: Rel(A, B),  $((\gamma_d^0)_{\overline{A}}, (\gamma_d^1)_{\overline{B}}) : F_d^* \overline{R} \to \varinjlim_{d \in \mathcal{D}} F_d^* \overline{R} \text{ is a morphism in Rel. So } \{(\gamma_d^0, \gamma_d^1)\}_{d \in \mathcal{D}} \text{ are the mediating } F_d^* \overline{R} \text{ is a morphism in Rel. } F_d^* \overline{R} \text{ is a morphism i$ morphisms of a cocone in  $RT_k$  with vertex  $\lim_{d \in \mathcal{D}} (F_d^0, F_d^1, F_d^*)$ . To see that this cocone is a colimiting cocone, let  $C = (C^0, C^1, C^*)$  be the vertex of a cocone for  $\{(F_d^0, F_d^1, F_d^*)\}_{d \in \mathcal{D}}$  with injections  $(\delta_d^0, \delta_d^1)$ :  $(F_d^0, F_d^1, F_d^*) \to C$ . If  $\eta^0 : \lim_{d \in \mathcal{D}} F_d^0 \to C^0$  and  $\eta^1 : \lim_{d \in \mathcal{D}} F_d^1 \to C^1$  are the mediating morphisms in  $[\operatorname{Set}^k, \operatorname{Set}]$ , then  $\eta^0$  and  $\eta^1$  are unique such that  $\delta_d^0 = \eta^0 \circ \gamma_d^0$  and  $\delta_d^1 = \eta^1 \circ \gamma_d^1$ . We therefore have that  $(\eta^0, \eta^1) : \varinjlim_{d \in \mathcal{D}} (F_d^0, F_d^1, F_d^*) \to C$  is the mediating morphism in  $RT_k$ . Indeed, for all  $\overline{R : Rel(A, B)}$ and  $(x,y) \in \varinjlim_{d \in \mathcal{D}} F_d^* \overline{R}$ , there exist d and  $(x',y') \in F_d^* \overline{R}$  such that  $(\gamma_d^0)_{\overline{A}} x' = x$  and  $(\gamma_d^1)_{\overline{B}} y' = y$ . But then  $(\eta_{\overline{A}}^0 x, \eta_{\overline{B}}^1 y) = (\eta_{\overline{A}}^0 ((\gamma_d^0)_{\overline{A}} x'), \eta_{\overline{B}}^1 ((\gamma_d^1)_{\overline{B}} y')) = ((\delta_d^0)_{\overline{A}} x', (\delta_d^1)_{\overline{B}} y')$ , and this pair is in  $C^* \overline{R}$  because  $(\delta_d^0, \delta_d^1)$  is a morphism from  $(F_d^0, F_d^1, F_d^*)$  to C in  $RT_k$ .

Definition 15. An endofunctor  $T = (T^0, T^1, T^*)$  on  $RT_k$  is  $\omega$ -cocontinuous if  $T^0$  and  $T^1$  are  $\omega$ cocontinuous endofunctors on  $[\mathsf{Set}^k, \mathsf{Set}]$  and  $T^*$  is an  $\omega$ -cocontinuous functor from  $RT_k$  to  $[\mathsf{Rel}^k, \mathsf{Rel}]$ , i.e., is in  $[RT_k, [Rel^k, Rel]]$ .

For any k and R: Rel(A, B), let  $K_R^{Rel}$  be the constantly R-valued functor from  $Rel^k$  to Rel, and for any k and set A, let  $K_A^{\mathsf{Set}}$  be the constantly A-valued functor from  $\mathsf{Set}^k$  to  $\mathsf{Set}$ . Moreover, let 0 denote either the initial object of Set or the initial object of Rel, depending on the context. Observing that, for every k,  $K_0^{\text{Set}}$  is initial in [Set<sup>k</sup>, Set], and similarly for  $K_0^{\text{Rel}}$ , we have that, for each k,  $K_0 = (K_0^{\mathsf{Set}}, K_0^{\mathsf{Set}}, K_0^{\mathsf{Rel}})$  is initial in  $RT_k$ . Thus, if  $T = (T^0, T^1, T^*) : RT_k \to RT_k$  is an endofunctor on  $RT_k$  then we can define  $\mu T$  to be the relation transformer

$$\mu T = \underline{\lim}_{n \in \mathbb{N}} T^n K_0$$

Then Lemma 14 shows  $\mu T$  is indeed a relation transformer, and that it is given explicitly by

$$\lim_{n \to \infty} T^n K_0 = (\mu T^0, \mu T^1, \lim_{n \to \infty} (T^n K_0)^*) \tag{3}$$

Lemma 16. For any  $T : [RT_k, RT_k], \mu T \cong T(\mu T)$ .

Proof. We have 
$$T(\mu T) = T(\underset{\longrightarrow}{\lim}_{n \in \mathbb{N}} (T^n K_0)) \cong \underset{\longrightarrow}{\lim}_{n \in \mathbb{N}} T(T^n K_0) = \mu T.$$

 In fact, the isomorphism in Lemma 16 is given by the morphisms  $(in_0, in_1) : T(\mu T) \to \mu T$  and  $(in_0^{-1}, in_1^{-1}) : \mu T \to T(\mu T)$  in  $RT_k$ . It is worth noting that the latter is always a morphism in  $RT_k$ , but the former isn't necessarily a morphism in  $RT_k$  unless T is  $\omega$ -cocontinuous.

Say realizing that not being able to define third components directly, but rather only through the other two components, is an important conceptual contribution. Not all functors on Rel are third components of relation transformers. It's overly restrictive to require that the third component of a functor on  $RT_k$  be a functor on all of  $[Rel^k, Rel]$ . For example, we can define  $T_\rho F$  when F is a relation transformer, but it is not clear how we could define  $T_\rho F$  when  $F: [Rel^k, Rel]$ .

Definition 17. A relation environment maps each type variable to a relation, and each type constructor variable of arity k to an  $\omega$ -cocontinuous k-ary relation transformer. A morphism  $f: \rho \to \rho'$  from a relation environment  $\rho$  to a relation environment  $\rho'$  such that  $\rho|_{\mathbb{V}} = \rho'|_{\mathbb{V}}$  maps each type variable v to  $id_{\rho v}$  and each type constructor variable  $\phi$  of arity k to a natural transformation from the k-ary relation transformer  $\rho \phi$  to the k-ary relation transformer  $\rho' \phi$ . Composition of morphisms on relation environments is given componentwise, with the identity morphism mapping each relation environment to itself. This gives a category of relation environments and morphisms between them, which we denote RelEnv.

When convenient we identify a 0-ary relation transformer with the relation (transformer) that is its codomain. With this convention, a relation environment maps a type constructor variable of arity 0 to a 0-ary relation transformer — i.e., to a relation — just as it does a type variable. We write  $\rho[\overline{\alpha} := \overline{R}]$  for the relation environment  $\rho'$  such that  $\rho'\alpha_i = R_i$  for i = 1, ..., k and  $\rho'\alpha = \rho\alpha$  if  $\alpha \notin \{\alpha_1, ..., \alpha_k\}$ . If  $\rho$  is a relation environment, we write  $\pi_1\rho$  for the set environment mapping each type variable  $\beta$  to  $\pi_1(\rho\beta)$  and each type constructor variable  $\phi$  to the functor  $(\rho\phi)^0$ . The set environment  $\pi_2\rho$  is defined analogously.

We define, for each k, the notion of an  $\omega$ -cocontinuous functor from RelEnv to  $RT_k$ :

DEFINITION 18. A functor  $H : [RelEnv, RT_k]$  is a triple  $H = (H^0, H^1, H^*)$ , where

- $H^0$  and  $H^1$  are objects in [SetEnv, [Set<sup>k</sup>, Set]]
- *H*\* is a an object in [RelEnv, [Rel<sup>k</sup>, Rel]]
- for all  $\overline{R: \text{Rel}(A,B)}$  and morphisms f in RelEnv,  $\pi_1(H^*f\overline{R}) = H^0(\pi_1f)\overline{A}$  and  $\pi_2(H^*f\overline{R}) = H^1(\pi_2f)\overline{B}$
- The action of H on  $\rho$  in RelEnv is given by  $H\rho = (H^0(\pi_1\rho), H^1(\pi_2\rho), H^*\rho)$
- The action of H on morphisms  $f: \rho \to \rho'$  in RelEnv is given by  $Hf = (H^0(\pi_1 f), H^1(\pi_2 f))$

Spelling out the last two bullet points above gives the following analogues of Conditions (1), (2), and (3) immediately following Definition 12:

(1) if  $R_1 : \text{Rel}(A_1, B_1), ..., R_k : \text{Rel}(A_k, B_k)$ , then

$$H^* \rho \, \overline{R} : \operatorname{Rel}(H^0(\pi_1 \rho) \, \overline{A}, H^1(\pi_2 \rho) \, \overline{B})$$

In other words,  $\pi_1(H^*\rho \overline{R}) = H^0(\pi_1\rho) \overline{A}$  and  $\pi_2(H^*\rho \overline{R}) = H^1(\pi_2\rho) \overline{B}$ .

(2) if  $(\alpha_1, \beta_1) \in \text{Hom}_{\text{Rel}}(R_1, S_1), ..., (\alpha_k, \beta_k) \in \text{Hom}_{\text{Rel}}(R_k, S_k)$ , then

$$H^*\rho\,\overline{(\alpha,\beta)}=(H^0(\pi_1\rho)\,\overline{\alpha},H^1(\pi_2\rho)\,\overline{\beta})$$

In other words,  $\pi_1(H^*\rho \overline{(\alpha,\beta)}) = H^0(\pi_1\rho) \overline{\alpha}$  and  $\pi_2(H^*\rho \overline{(\alpha,\beta)}) = H^1(\pi_2\rho) \overline{\beta}$ .

(3) if  $f: \rho \to \rho'$  and  $R_1: \mathsf{Rel}(A_1, B_1), ..., R_k: \mathsf{Rel}(A_k, B_k)$ , then

if 
$$(x, y) \in H^* \rho \overline{R}$$
 then  $(H^0(\pi_1 f) \overline{A} x, H^1(\pi_2 f) \overline{B} y) \in H^* \rho' \overline{R}$ 

Note, however, that this condition is automatically satisfied because it is implied by the third bullet point of Definition 18.

Considering RelEnv as a product  $\Pi_{\phi^k \in \mathbb{V} \cup \mathbb{T}} RT_k$ , we extend Lemma 14 to compute colimits in RelEnv componentwise, and similarly extend Definition 15 to give a componentwise notion of  $\omega$ -cocontinuity of functors from RelEnv to  $RT_k$ .

We recall from the start of this section that Definition 19 is given mutually inductively with Definition 26. We can, at last, define:

Definition 19. Let  $\rho$  be a relation environment. The relation interpretation  $[\![\cdot]\!]^{Rel}: \mathcal{F} \to [RelEnv, Rel]$  is defined by

```
\llbracket \Gamma : \emptyset \vdash \upsilon \rrbracket^{\text{Rel}} \rho = \rho \upsilon \text{ if } \upsilon \in \mathbb{V}
                   \llbracket \Gamma : \emptyset \vdash \sigma \to \tau \rrbracket^{\mathsf{Rel}} \rho = \llbracket \Gamma ; \emptyset \vdash \sigma \rrbracket^{\mathsf{Rel}} \rho \to \llbracket \Gamma ; \emptyset \vdash \tau \rrbracket^{\mathsf{Rel}} \rho
                                                                                            need to interpret forall types if we include them
         \llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} F G \rrbracket^{\mathsf{Rel}} \rho = \{ \eta : \llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\mathsf{Rel}} \rho [\overline{\alpha} := -] \Rightarrow \llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\mathsf{Rel}} \rho [\overline{\alpha} := -] \}
                                                                                             = \{(t, t') \in \mathbb{F}: \emptyset \in \mathbb{N} \text{at}^{\overline{\alpha}} FG \mathbb{I}^{\text{Set}}(\pi_1 \rho) \times \mathbb{F}: \emptyset \in \mathbb{N} \text{at}^{\overline{\alpha}} FG \mathbb{I}^{\text{Set}}(\pi_2 \rho) \mid
                                                                                                              \forall R_1 : \text{Rel}(A_1, B_1) \dots R_k : \text{Rel}(A_k, B_k).
                                                                                                                     (t_{\overline{A}},t_{\overline{R}}')\in ([\![\Gamma;\overline{\alpha}\vdash G]\!]^{\mathrm{Rel}}\rho[\overline{\alpha:=R}])^{[\![\Gamma;\overline{\alpha}\vdash F]\!]^{\mathrm{Rel}}\rho[\overline{\alpha:=R}]}\}
                                                                                              = \{(t, t') \in \llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} F G \rrbracket^{\mathsf{Set}}(\pi_1 \rho) \times \llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} F G \rrbracket^{\mathsf{Set}}(\pi_2 \rho) \mid
                                                                                                               \forall R_1 : \operatorname{Rel}(A_1, B_1) \dots R_k : \operatorname{Rel}(A_k, B_k).
                                                                                                                     \forall (a,b) \in \llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\mathsf{Rel}} \rho [\overline{\alpha} := R].
                                                                                                                            (t_{\overline{A}}a, t_{\overline{B}}'b) \in \llbracket\Gamma; \overline{\alpha} \vdash G\rrbracket^{\mathsf{Rel}} \rho[\overline{\alpha} := R]\}
                                      \llbracket \Gamma ; \Phi \vdash \mathbb{O} \rrbracket^{\text{Rel}} \rho = 0
                                      \llbracket \Gamma ; \Phi \vdash \mathbb{1} \rrbracket^{\text{Rel}} \rho = 1
                                  \llbracket \Gamma : \Phi \vdash \phi \overline{\tau} \rrbracket^{\text{Rel}} \rho = (\rho \phi) \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\text{Rel}} \rho}
                       \llbracket \Gamma ; \Phi \vdash \sigma + \tau \rrbracket^{\mathsf{Rel}} \rho = \llbracket \Gamma ; \Phi \vdash \sigma \rrbracket^{\mathsf{Rel}} \rho + \llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Rel}} \rho
                       \llbracket \Gamma ; \Phi \vdash \sigma \times \tau \rrbracket^{\mathsf{Rel}} \rho = \llbracket \Gamma ; \Phi \vdash \sigma \rrbracket^{\mathsf{Rel}} \rho \times \llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Rel}} \rho
\llbracket \Gamma; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket^{\mathsf{Rel}} \rho = (\mu T_{\rho}) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Rel}} \rho}
                                                         where T_{\rho} = (T_{\pi_1 \rho}^{\text{Set}}, T_{\pi_2 \rho}^{\text{Set}}, T_{\rho}^{\text{Rel}})
                                                      and T_{\rho}^{\text{Rel}}F = \lambda \overline{R}. \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\text{Rel}} \rho [\phi := F] [\overline{\alpha := R}]
                                                       and T_{\rho}^{\mathsf{Rel}}\delta = \lambda \overline{R}. \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Rel}} id_{\rho} [\phi := \delta] [\overline{\alpha := id_{\overline{R}}}]
```

If  $\rho$  is a relational environment and  $\vdash \tau : \mathcal{F}$ , then we write  $\llbracket \vdash \tau \rrbracket^{\text{Rel}}$  instead of  $\llbracket \emptyset ; \emptyset \vdash \tau \rrbracket^{\text{Rel}} \rho$  as for set interpretations.

For the last clause in Definition 19 to be well-defined, we need to know that  $T_{\rho}$  is an  $\omega$ -cocontinuous endofunctor on RT so that, by Definition 16, it admits a fixed point. Since  $T_{\rho}$  is defined in terms of  $\llbracket \Gamma; \Phi, \phi^k, \overline{\alpha} \vdash H \rrbracket^{\text{Rel}}$ , this means that relational interpretations of types must be  $\omega$ -cocontinuous functors from RelEnv to  $RT_0$ . This in turn means that the actions of relational interpretations of types on objects and on morphisms in RelEnv are intertwined. In fact, we already know from [Johann and Polonsky 2019] that, for every  $\Gamma; \overline{\alpha} \vdash \tau : \mathcal{F}, \llbracket \Gamma; \overline{\alpha} \vdash \tau \rrbracket^{\text{Rel}}$  is actually functorial in  $\overline{\alpha}$  and  $\omega$ -cocontinuous. We first define the actions of each of these functors on morphisms between environments, and then argue that the functors given by Definitions 19 and 20 are well-defined and have the required properties.

 DEFINITION 20. Let  $f: \rho \to \rho'$  for relation environments  $\rho$  and  $\rho'$  such that  $\rho|_{\mathbb{V}} = \rho'|_{\mathbb{V}}$ . The action  $[\![\Gamma; \Phi \vdash \tau]\!]^{\text{Rel}} f$  of  $[\![\Gamma; \Phi \vdash \tau]\!]^{\text{Rel}}$  on the morphism f is given as follows:

- $\bullet \ \ \textit{If} \ \Gamma, \upsilon; \emptyset \vdash \upsilon \ \textit{then} \ \llbracket \Gamma, \upsilon; \emptyset \vdash \upsilon \rrbracket^{\mathsf{Rel}} f = id_{\rho \upsilon}.$
- If  $\Gamma : \emptyset \vdash \sigma \to \tau$  then  $[\![\Gamma : \emptyset \vdash \sigma \to \tau]\!]^{\text{Rel}} f = id_{[\![\Gamma : \emptyset \vdash \sigma \to \tau]\!]^{\text{Rel}} \rho}$ .
- If  $\Gamma$ ;  $\emptyset \vdash \operatorname{Nat}^{\overline{\alpha}} FG$ , then we define  $[\![\Gamma; \emptyset \vdash \operatorname{Nat}^{\overline{\alpha}} FG]\!]^{\operatorname{Rel}} f = id_{\Gamma : \emptyset \vdash \operatorname{Nat}^{\overline{\alpha}} FG]^{\operatorname{Rel}} \rho}$ .
- If  $\Gamma$ ;  $\Phi \vdash \mathbb{O}$  then  $[\![\Gamma; \Phi \vdash \mathbb{O}]\!]^{\text{Rel}} f = id_0$ .
- If  $\Gamma$ ;  $\Phi \vdash \mathbb{1}$  then  $\llbracket \Gamma ; \Phi \vdash \mathbb{1} \rrbracket^{\text{Rel}} f = id_1$ .
- If  $\Gamma$ ;  $\Phi \vdash \phi \overline{\tau}$ , then we have that  $\llbracket \Gamma ; \Phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Rel}} f : \llbracket \Gamma ; \Phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Rel}} \rho \to \llbracket \Gamma ; \Phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Rel}} \rho' = (\rho \phi) \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\operatorname{Rel}} \rho} \to (\rho' \phi) \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\operatorname{Rel}} \rho'}$  is defined by  $\llbracket \Gamma ; \Phi \vdash \phi \tau A \rrbracket^{\operatorname{Rel}} f = (f \phi)_{\overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\operatorname{Rel}} \rho'}} \circ (\rho \phi) \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\operatorname{Rel}} f} \circ (f \phi)_{\overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\operatorname{Rel}} \rho}}.$
- If  $\Gamma$ ;  $\Phi \vdash \sigma + \tau$  then  $\llbracket \Gamma$ ;  $\Phi \vdash \sigma + \tau \rrbracket^{\text{Rel}} f$  is defined by  $\llbracket \Gamma$ ;  $\Phi \vdash \sigma + \tau \rrbracket^{\text{Rel}} f (\text{inl } x) = \text{inl } (\llbracket \Gamma; \Phi \vdash \sigma \rrbracket^{\text{Rel}} f x)$  and  $\llbracket \Gamma; \Phi \vdash \sigma + \tau \rrbracket^{\text{Rel}} f (\text{inr } y) = \text{inr } (\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}} f y)$ .
- If  $\Gamma$ ;  $\Phi \vdash \sigma \times \tau$  then  $\llbracket \Gamma; \Phi \vdash \sigma \times \tau \rrbracket^{\text{Rel}} f = \llbracket \Gamma; \Phi \vdash \sigma \rrbracket^{\text{Rel}} f \times \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}} f$ .
- If  $\Gamma$ ;  $\Phi \vdash (\mu \phi^k . \lambda \overline{\alpha} . H) \overline{\tau}$  then letting  $\sigma_f : T_\rho \to T_{\rho'}$  be the map

$$F \mapsto \lambda \overline{R}. \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Rel}} f[\phi := id_F] [\overline{\alpha := id_R}]$$

we define

$$\begin{split} & & \llbracket \Gamma; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket^{\text{Rel}} f \\ &= & (\mu \sigma_f) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}} \rho'} \circ (\mu T_\rho) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}} f} ) \\ &= & (\mu T_{\rho'}) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}} f} \circ (\mu \sigma_f) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}} \rho} \end{split}$$

To see that the functors given by Definitions 19 and 20 are well-defined we must show that  $T_{\rho}F$  is a relation transformer for any relation transformer F, and that  $\sigma_f F: T_{\rho}F \to T_{\rho'}F$  is a morphism of relation transformers for every relation transformer F and every morphism  $f: \rho \to \rho'$  in RelEnv.

LEMMA 21. The interpretations in Definitions 19 and 20 are well-defined and, for every  $\Gamma; \Phi \vdash \tau$ ,

$$\llbracket \Gamma ; \Phi \vdash \tau \rrbracket = (\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Set}}, \llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Set}}, \llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Rel}})$$

is an  $\omega$ -cocontinuous functor from RelEnv to  $RT_0$ , i.e., is an element of [RelEnv,  $RT_0$ ].

PROOF. By induction on the structure of  $\tau$ . The only interesting cases are when  $\tau = \phi \overline{\tau}$  and when  $\tau = (\mu \phi^k. \lambda \overline{\alpha}. H) \overline{\tau}$ . We consider each in turn.

• When  $\tau = \Gamma$ ;  $\Phi \vdash \phi \overline{\tau}$ , we have

$$\pi_{i}(\llbracket\Gamma; \Phi \vdash \phi\overline{\tau}\rrbracket^{\text{Rel}}\rho)$$

$$= \pi_{i}((\rho\phi)[\![\Gamma; \Phi \vdash \tau\rrbracket^{\text{Rel}}\rho)]$$

$$= (\pi_{i}(\rho\phi))(\pi_{i}([\![\Gamma; \Phi \vdash \tau\rrbracket]^{\text{Rel}}\rho))$$

$$= ((\pi_{i}\rho)\phi)([\![\Gamma; \Phi \vdash \tau\rrbracket]^{\text{Set}}(\pi_{i}\rho))$$

$$= [\![\Gamma; \Phi \vdash \phi\overline{\tau}\rrbracket]^{\text{Set}}(\pi_{i}\rho)$$

and, for  $f: \rho \to \rho'$  in RelEnv,

$$\begin{split} &\pi_{i}(\llbracket\Gamma;\Phi \vdash \phi\overline{\tau}\rrbracket^{\text{Rel}}f)\\ &=&\pi_{i}((f\phi)_{\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\text{Rel}}\rho'}) \circ \pi_{i}((\rho\phi)(\overline{\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\text{Rel}}f}))\\ &=&(\pi_{i}(f\phi))_{\overline{\pi_{i}}(\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\text{Rel}}\rho')} \circ (\pi_{i}(\rho\phi))(\overline{\pi_{i}}(\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\text{Rel}}f}))\\ &=&((\pi_{i}f)\phi)_{\overline{\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\text{Set}}(\pi_{i}\rho')}} \circ ((\pi_{i}\rho)\phi)(\overline{\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\text{Set}}(\pi_{i}f)})\\ &=&\llbracket\Gamma;\Phi \vdash \phi\overline{\tau}\rrbracket^{\text{Set}}(\pi_{i}f)\end{split}$$

1:12 Anon.

The third equalities of each of the above derivations are by the induction hypothesis. That  $\llbracket \Gamma; \Phi \vdash \phi \overline{\tau} \rrbracket$  is  $\omega$ -cocontinuous is an immediate consequence of the facts that Set and Rel are locally finitely presentable, together with Corollary 12 of [Johann and Polonsky 2019].

- When  $\tau = (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau}$  we first show that  $[(\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau}]$  is well-defined.
  - $-\frac{T_{\rho}:[RT_k,RT_k]}{T_{\rho}F}$ : We must show that, for any relation transformer  $F=(F^0,F^1,F^*)$ , the triple  $\overline{T_{\rho}F}=(T_{\pi_1\rho}^{\text{Set}}F^0,T_{\pi_2\rho}^{\text{Set}}F^1,T_{\rho}^{\text{Rel}}F)$  is also a relation transformer. Let  $\overline{R}:\text{Rel}(A,B)$ . Then for i=1,2, we have

$$\begin{split} \pi_i(T^{\text{Rel}}_{\rho} F \, \overline{R}) &= \pi_i(\llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\text{Rel}} \rho [\phi := F] \overline{[\alpha := R]}) \\ &= \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\text{Set}} (\pi_i (\rho [\phi := F] \overline{[\alpha := R]})) \\ &= \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\text{Set}} (\pi_i \rho) [\phi := \pi_i F] \overline{[\alpha := \pi_i R]}) \\ &= T^{\text{Set}}_{\pi_i \rho} (\pi_i F) (\overline{\pi_i R}) \end{split}$$

and

$$\begin{split} \pi_i(T_\rho^{\mathsf{Rel}} \, F \, \overline{\gamma}) &= \pi_i(\llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Rel}} id_\rho [\phi := id_F] \overline{[\alpha := \gamma]}) \\ &= \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Set}} (\pi_i (id_\rho [\phi := id_F] \overline{[\alpha := \gamma]})) \\ &= \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Set}} id_{\pi_i \rho} [\phi := id_{\pi_i F}] \overline{[\alpha := \pi_i \gamma]} \\ &= T_{\pi_i \rho}^{\mathsf{Set}} (\pi_i F) (\overline{\pi_i \gamma}) \end{split}$$

Here, the second equality in each of the above chains of equalities is by the induction hypothesis.

We also have that, for every morphism  $\delta = (\delta^0, \delta^1) : F \to G$  in  $RT_k$  and all  $\overline{R : Rel(A, B)}$ ,

$$\begin{split} & \pi_i((T_\rho^{\mathsf{Rel}}\delta)_{\overline{R}}) \\ &= & \pi_i(\llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Rel}} id_\rho[\phi := \delta] \overline{[\alpha := id_R]}) \\ &= & \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Set}} id_{\pi_i \rho}[\phi := \pi_i \delta] \overline{[\alpha := id_{\pi_i R}]} \\ &= & (T_{\pi_i \rho}^{\mathsf{Set}}(\pi_i \delta))_{\overline{\pi_i R}} \end{split}$$

Here, the second equality is by the induction hypothesis. That  $T_{\rho}$  is  $\omega$ -cocontinuous follows immediately from the induction hypothesis on  $[\![\Gamma; \Phi, \phi, \overline{\alpha} \vdash H]\!]$  and the fact that colimts are computed componentwise in RT.

 $-\sigma_f = (\sigma_{\pi_1 f}^{\text{Set}}, \sigma_{\pi_2 f}^{\text{Set}}) \text{ is a natural transformation from } T_\rho \text{ to } T_{\rho'} \text{: We must show that } (\sigma_f)_F = \overline{((\sigma_{\pi_1 f}^{\text{Set}})_{F^0}, (\sigma_{\pi_2 f}^{\text{Set}})_{F^1})} \text{ is a morphism in } RT_k \text{ for all relation transformers } F = (F^0, F^1, F^*), \text{ i.e.,}$ that  $((\sigma_f)_F)_{\overline{R}} = (((\sigma_{\pi_1 f}^{\text{Set}})_{F^0})_{\overline{A}}, ((\sigma_{\pi_2 f}^{\text{Set}})_{F_1})_{\overline{B}}) \text{ is a morphism in Rel for all relations } \overline{R : \text{Rel}(A, B)}.$  Indeed, we have that

$$((\sigma_f)_F)_{\overline{R}} = [\![\Gamma; \Phi, \phi, \overline{\alpha} \vdash H]\!]^{\mathsf{Rel}} f[\phi := id_F] \overline{[\alpha := id_R]}$$

is a morphism in  $RT_0$  (and thus in Rel) by the induction hypothesis.

The relation transformer  $\mu T_{\rho}$  is therefore a fixed point of  $T_{\rho}$  by Lemma 16, and  $\mu \sigma_f$  is a morphism in  $RT_k$  from  $\mu T_{\rho}$  to  $\mu T_{\rho'}$ . ( $\mu$  is shown to be a functor in [Johann and Polonsky 2019].) So  $[\Gamma; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau}]^{\text{Rel}}$ , and thus  $[\Gamma; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau}]$ , is well-defined.

To see that  $\llbracket \Gamma; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket$ : [RelEnv,  $RT_0$ ], we must verify three conditions:

 - Condition (1) after Definition 18 is satisfied since

$$\begin{split} \pi_i(\llbracket\Gamma;\Phi \vdash (\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}\rrbracket^{\mathrm{Rel}}\rho) &= \pi_i((\mu T_\rho)(\overline{\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\mathrm{Rel}}\rho})) \\ &= \pi_i(\mu T_\rho)(\overline{\pi_i(\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\mathrm{Rel}}\rho})) \\ &= \mu T_{\pi_i\rho}^{\mathrm{Set}}(\overline{\llbracket\Gamma;\Phi \vdash \tau\rrbracket^{\mathrm{Set}}(\pi_i\rho})) \\ &= \llbracket\Gamma;\Phi \vdash (\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}\rrbracket^{\mathrm{Set}}(\pi_i\rho) \end{split}$$

The third equality is by Equation 3 and the induction hypothesis.

- Condition (2) after Definition 18 is satisfied since it is subsumed by the previous condition because k = 0.
- The third bullet point of Definition 18 is satisfied because

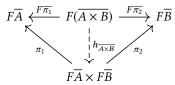

$$\begin{split} &\pi_{i}(\llbracket\Gamma;\Phi\vdash(\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}\rrbracket^{\mathrm{Rel}}f)\\ &=\pi_{i}((\mu T_{\rho'})(\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Rel}}f})\circ(\mu\sigma_{f})_{\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Rel}}\rho}})\\ &=\pi_{i}((\mu T_{\rho'})(\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Rel}}f}))\circ\pi_{i}((\mu\sigma_{f})_{\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Rel}}\rho}})\\ &=\pi_{i}(\mu T_{\rho'})(\overline{\pi_{i}(\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Rel}}f}))\circ\pi_{i}(\mu\sigma_{f})_{\overline{\pi_{i}(\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Rel}}\rho)}}\\ &=(\mu T_{\pi_{i}\rho'}^{\mathrm{Set}})(\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}(\pi_{i}f)})\circ(\mu\sigma_{\pi_{i}f}^{\mathrm{Set}})_{\overline{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}(\pi_{i}\rho)}}\\ &=\llbracket\Gamma;\Phi\vdash(\mu\phi.\lambda\overline{\alpha}.H)\overline{\tau}\rrbracket^{\mathrm{Set}}(\pi_{i}f). \end{split}$$

The fourth equality is by 3 and the induction hypothesis.

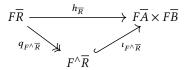

As before, that  $\llbracket \Gamma; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket$  is  $\omega$ -concontinuous follows from the facts that Set and Rel are locally finitely presentable, and that colimits in RelEnv are computed componentwise, together with Corollary 12 of [Johann and Polonsky 2019].

#### 3.3 The Identity Extension Lemma

DEFINITION 22. If F is a functor from  $\operatorname{Set}^k$  to  $\operatorname{Set}$ , we define the functor  $\operatorname{Eq}_F^*: \operatorname{Rel}^k \to \operatorname{Rel}$  as follows. Given  $R_1: \operatorname{Rel}(A_1, B_1), ..., R_k: \operatorname{Rel}(A_k, B_k)$ , let  $\iota_{R_i}: R_i \hookrightarrow A_i \times B_i$ , for i=1,...,k, be the inclusion of  $R_i$  as a subset of  $A_i \times B_i$ . By the universal property of the product, there exists a unique  $h_{\overline{A \times B}}$  making the diagram

commute. Let  $h_{\overline{R}}: F\overline{R} \to F\overline{A} \times F\overline{B}$  be  $h_{\overline{A} \times \overline{B}} \circ F\overline{\iota_R}$ . Define  $F^{\wedge}\overline{R}$  to be the subobject through which  $h_{\overline{R}}$  is factorized by the mono-epi factorization system in Set, as shown in the following diagram:

Note that  $F^{\wedge}\overline{R}: \operatorname{Rel}(F\overline{A}, F\overline{B})$  by construction, so we can define  $\operatorname{Eq}_F^*\overline{(A,B,R)} = (F\overline{A}, F\overline{B}, \iota_{F^{\wedge}\overline{R}}F^{\wedge}\overline{R})$ . Moreover, if  $\overline{(\alpha,\beta)}: \overline{(A,B,R)} \to \overline{(C,D,S)}$  are morphisms in Rel, then we define  $\operatorname{Eq}_F^*(\overline{\alpha},\overline{\beta})$  to be  $(F\overline{\alpha},F\overline{\beta})$ .

Proc. ACM Program. Lang., Vol. 1, No. POPL, Article 1. Publication date: January 2020.

 If F is a functor from  $\operatorname{Set}^k$  to  $\operatorname{Set}$ , let  $\operatorname{Eq}_F = (F, F, \operatorname{Eq}_F^*)$ . Note that if A: Set then  $\operatorname{Eq}_A$  is precisely as defined in Section 1.1. This is consistent with the fact that a set can be seen as a 0-ary functor on sets and a relation can be seen as a 0-ary functor on relations.

LEMMA 23. If  $F : [Set^k, Set]$  then  $Eq_F$  is in  $RT_k$ .

PROOF. Clearly, Eq<sup>\*</sup> is  $\omega$ -cocontinuous, so Eq<sup>\*</sup> : [Rel<sup>k</sup>, Rel].

Now, consider  $(\alpha, \beta): R \to S$ , where  $\overline{R: Rel(A, B)}$  and  $\overline{S: Rel(C, D)}$ . We want to show that there exists a morphism  $\epsilon: F^{\wedge} \overline{R} \to F^{\wedge} \overline{S}$  such that

commutes. By hypothesis, there exist  $\overline{\gamma:R\to S}$  such that each diagram

$$R_{i} \xrightarrow{\iota_{R_{i}}} A_{i} \times B_{i}$$

$$\downarrow_{\gamma_{i}} \qquad \downarrow_{\alpha_{i} \times \beta_{i}}$$

$$S_{i} \xrightarrow{\iota_{S_{i}}} C_{i} \times D_{i}$$

commutes. Now note that both  $h_{\overline{C \times D}} \circ F(\overline{\alpha \times \beta})$  and  $(F\overline{\alpha} \times F\overline{\beta}) \circ h_{\overline{A \times B}}$  make

$$F\overline{C} \xleftarrow{\pi_1} F\overline{C} \times F\overline{D} \xrightarrow{\pi_2} F\overline{D}$$

$$F\pi_1 \circ F(\overline{\alpha \times \beta}) \qquad \downarrow \qquad F\pi_2 \circ F(\overline{\alpha \times \beta})$$

$$F(\overline{A \times B})$$

commute, so they must be equal. We therefore get that the right-hand square below commutes, and thus that the entire following diagram does as well:

$$F\overline{R} \xrightarrow{F_{I\overline{R}}} F(\overline{A \times B}) \xrightarrow{h_{\overline{A} \times \overline{B}}} F\overline{A} \times F\overline{B}$$

$$F\overline{Y} \downarrow \qquad \qquad \downarrow_{F(\overline{\alpha} \times \overline{\beta})} \qquad \downarrow_{F\overline{\alpha} \times F\overline{\beta}}$$

$$F\overline{S} \xrightarrow{F_{I\overline{S}}} F(\overline{C \times D}) \xrightarrow{h_{\overline{C} \times \overline{D}}} F\overline{C} \times F\overline{D}$$

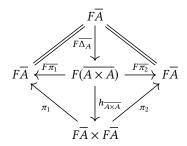

Finally, by the left-lifting property of  $q_{F^{\wedge}\overline{R}}$  with respect to  $\iota_{F^{\wedge}\overline{S}}$  given by the epi-mono factorization system, there exists an  $\epsilon$  such that the diagram

commutes.

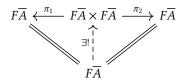

LEMMA 24. If  $F : [Set^k, Set]$  and  $A_1, ..., A_k : Set$ , then  $Eq_F^* \overline{Eq_A} = Eq_{F\overline{A}}$ .

Proc. ACM Program. Lang., Vol. 1, No. POPL, Article 1. Publication date: January 2020.

 PROOF. Each Eq<sub>A</sub>: Rel has as its third component  $\Delta_A A$ , where  $\Delta_A: A \to A \times A$  is given by  $\Delta_A A = \{(x,x) \mid x \in A\}$ . Since  $h_{\overline{A \times A}}$  is the unique morphism making the bottom triangle of the following diagram commute

and since  $h_{\overline{Eq}_A^*} = h_{\overline{A} \times A} \circ F \overline{\Delta_A}$ , the universal property of the product

gives that  $h_{\overline{\operatorname{Eq}_A^*}} = \Delta_{F\overline{A}}$ . Moreover, since  $\Delta_{F\overline{A}}$  is a monomorphism, its epi-mono factorization gives that  $\Delta_{F\overline{A}} = \iota_{F^\wedge\overline{\Delta_A}}$ , and thus that  $F^\wedge\overline{\Delta_A} = F\overline{A}$ . Therefore,  $\operatorname{Eq}_F^*\overline{\operatorname{Eq}_A} = (F\overline{A}, F\overline{A}, \iota_{F^\wedge\overline{\Delta_A}} F^\wedge\overline{\Delta_A}) = (F\overline{A}, F\overline{A}, \Delta_{F\overline{A}} F\overline{A}) = \operatorname{Eq}_{F\overline{A}}$ .

We now show that the Identity Extension Lemma holds for the interpretations given in Definitions 26 and 19. If  $\rho$  is a set environment, define  $\operatorname{Eq}_{\rho}$  to be the relation environment such that  $\operatorname{Eq}_{\rho} v = \operatorname{Eq}_{\rho v}$  for all  $v \in \mathbb{V} \cup \mathbb{T}$ . This is exactly the same definition that was given informally in Section 3.1. The Identity Extension Lemma can then be stated and proved as follows:

Theorem 25. If  $\rho$  is a set environment, and  $\Gamma; \Phi \vdash \tau : \mathcal{F}$ , then  $[\![\Gamma; \Phi \vdash \tau]\!]^{\mathrm{Rel}} \mathsf{Eq}_{\rho} = \mathsf{Eq}_{[\![\Gamma; \Phi \vdash \tau]\!]^{\mathrm{Set}} \rho}$ .

PROOF. By induction on the structure of  $\tau$ .

- $\bullet \ \ \llbracket \Gamma; \emptyset \vdash \upsilon \rrbracket^{\mathsf{Rel}} \mathsf{Eq}_{\rho} = \mathsf{Eq}_{\rho} \upsilon = \mathsf{Eq}_{\rho \upsilon} = \mathsf{Eq}_{\llbracket \Gamma; \emptyset \vdash \upsilon \rrbracket^{\mathsf{Set}} \rho} \text{ where } \upsilon \in \Gamma.$
- $\llbracket \Gamma; \emptyset \vdash \sigma \to \tau \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\rho} = \llbracket \Gamma; \emptyset \vdash \sigma \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\rho} \to \llbracket \Gamma; \emptyset \vdash \tau \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\rho} = \mathsf{Eq}_{\llbracket \Gamma; \emptyset \vdash \sigma \rrbracket^{\mathrm{Set}} \rho} \to \mathsf{Eq}_{\llbracket \Gamma; \emptyset \vdash \tau \rrbracket^{\mathrm{Set}} \rho} = \mathsf{Eq}_{\llbracket \Gamma; \emptyset \vdash \sigma \to \tau \rrbracket^{\mathrm{Set}} \rho},$  where the second equality is by the induction hypothesis.
- $\tau = \forall v.\tau_1$
- By definition,  $\llbracket \Gamma; \emptyset \vdash \operatorname{Nat}^{\overline{\alpha}} FG \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho}$  is the relation on  $\llbracket \Gamma; \emptyset \vdash \operatorname{Nat}^{\overline{\alpha}} FG \rrbracket^{\operatorname{Set}} \rho$  relating t and t' if, for all  $R_1 : \operatorname{Rel}(A_1, B_1), ..., R_k : \operatorname{Rel}(A_k, B_k), (t_{\overline{A}}, t'_{\overline{B}})$  is a morphism from  $\llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  to  $\llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  in Rel. To prove that this is equal to  $\operatorname{Eq}_{\llbracket \Gamma; \emptyset \vdash \operatorname{Nat}^{\overline{\alpha}} FG \rrbracket^{\operatorname{Set}} \rho}$  we need to show that  $(t_{\overline{A}}, t'_{\overline{B}})$  is a morphism from  $\llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  to  $\llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  in Rel for all  $R_1 : \operatorname{Rel}(A_1, B_1), ..., R_k : \operatorname{Rel}(A_k, B_k)$  if and only if t = t' and  $(t_{\overline{A}}, t_{\overline{B}})$  is a morphism from  $\llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  to  $\llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  in Rel for all  $R_1 : \operatorname{Rel}(A_1, B_1), ..., R_k : \operatorname{Rel}(A_k, B_k)$ . The only interesting part of this equivalence is to show that if  $(t_{\overline{A}}, t'_{\overline{B}})$  is a morphism from  $\llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  to  $\llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := R]}$  in Rel for all  $R_1 : \operatorname{Rel}(A_1, B_1), ..., R_k : \operatorname{Rel}(A_k, B_k)$ , then t = t'. By hypothesis,  $(t_{\overline{A}}, t'_{\overline{A}})$  is a morphism from  $\llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := Eq_A]}$  to  $\llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\operatorname{Rel}} \operatorname{Eq}_{\rho} \overline{[\alpha := Eq_A]}$  in Rel for all  $R_1 : \operatorname{Rel}(R_1, R_2)$ .

1:16 Anon.

therefore a morphism from  $\mathsf{Eq}_{\llbracket\Gamma;\overline{\alpha}\vdash F\rrbracket^{\mathsf{Set}}\rho\overline{[\alpha:=A]}}$  to  $\mathsf{Eq}_{\llbracket\Gamma;\overline{\alpha}\vdash G\rrbracket^{\mathsf{Set}}\rho\overline{[\alpha:=A]}}$  in Rel. This means that, for every  $x:\mathsf{Eq}_{\llbracket\Gamma;\overline{\alpha}\vdash F\rrbracket^{\mathsf{Set}}\rho\overline{[\alpha:=A]}}$ ,  $t_{\overline{A}}x=t_{\overline{A}}'x$ . Then, by extensionality, t=t'.

 $\bullet \ [\![\Gamma;\Phi \vdash \mathbb{O}]\!]^{\mathrm{Rel}} \mathsf{Eq}_{\rho} = 0_{\mathrm{Rel}} = \mathsf{Eq}_{0_{\mathrm{Set}}} = \mathsf{Eq}_{[\![\Gamma;\Phi \vdash \mathbb{O}]\!]^{\mathrm{Set}}\rho}$ 

- $\bullet \ \ \llbracket \Gamma ; \Phi \vdash \mathbb{1} \rrbracket^{\mathsf{Rel}} \mathsf{Eq}_{\rho} = 1_{\mathsf{Rel}} = \mathsf{Eq}_{1_{\mathsf{Set}}} = \mathsf{Eq}_{\llbracket \Gamma ; \Phi \vdash \mathbb{1} \rrbracket^{\mathsf{Set}} \rho}$
- The application case is proved by the following sequence of equalities, where the second equality is by the induction hypothesis and the definition of the relation environment  $Eq_{\rho}$ , the third is by the definition of application of relation transformers from Definition 10, and the fourth is by Lemma 24:

$$\begin{split} \llbracket \Gamma; \Phi \vdash \phi \overline{\tau} \rrbracket^{\text{Rel}} \mathsf{Eq}_{\rho} &= (\mathsf{Eq}_{\rho} \phi) \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}} \mathsf{Eq}_{\rho}} \\ &= \mathsf{Eq}_{\rho \phi} \, \overline{\mathsf{Eq}_{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Set}} \rho}} \\ &= (\mathsf{Eq}_{\rho \phi})^* \, \overline{\mathsf{Eq}_{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Set}} \rho}} \\ &= \mathsf{Eq}_{(\rho \phi)} \overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Set}} \rho} \\ &= \mathsf{Eq}_{\llbracket \Gamma; \Phi \vdash \phi \overline{\tau} \rrbracket^{\text{Set}} \rho} \end{split}$$

• The fixed point case is proven by the sequence of equalities

$$\begin{split} \llbracket \Gamma ; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket^{\text{Rel}} \mathsf{Eq}_{\rho} &= (\mu T_{\mathsf{Eq}_{\rho}}) \, \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\text{Rel}} \mathsf{Eq}_{\rho}} \\ &= \lim_{\substack{n \in \mathbb{N}}} T_{\mathsf{Eq}_{\rho}}^{n} K_{0} \, \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\text{Rel}} \mathsf{Eq}_{\rho}} \\ &= \lim_{\substack{n \in \mathbb{N}}} T_{\mathsf{Eq}_{\rho}}^{n} K_{0} \, \overline{\mathsf{Eq}_{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\text{Set}} \rho}} \\ &= \lim_{\substack{n \in \mathbb{N}}} \left( \mathsf{Eq}_{(T_{\rho}^{\mathsf{Set}})^{n} K_{0}} \right)^{*} \overline{\mathsf{Eq}_{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho}} \\ &= \lim_{\substack{n \in \mathbb{N}}} \mathsf{Eq}_{(T_{\rho}^{\mathsf{Set}})^{n} K_{0}} \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho} \\ &= \mathsf{Eq}_{\lim_{\substack{n \in \mathbb{N}}\\ n \in \mathbb{N}}} (T_{\rho}^{\mathsf{Set}})^{n} K_{0} \, \overline{\llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho} \\ &= \mathsf{Eq}_{\llbracket \Gamma ; \Phi \vdash (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket^{\mathsf{Set}} \rho} \end{split}$$

Here, the third equality is by induction hypothesis, the fifth is by Lemma 24 and the fourth equality is because, for every  $n \in \mathbb{N}$ , the following two statements can be proved by simultaneous induction:

$$T_{\mathsf{Eq}_{\rho}}^{n} K_{0} \, \overline{\mathsf{Eq}_{\llbracket \Gamma; \Phi \vdash \tau \rrbracket}^{\mathsf{Set}} \rho} = (\mathsf{Eq}_{(T_{\rho}^{\mathsf{Set}})^{n} K_{0}})^{*} \overline{\mathsf{Eq}_{\llbracket \Gamma; \Phi \vdash \tau \rrbracket}^{\mathsf{Set}} \rho} \tag{4}$$

and

We prove (4). The case n=0 is trivial, because  $T_{\mathsf{Eq}_{\rho}}^{0}K_{0}=K_{0}$  and  $(T_{\rho}^{\mathsf{Set}})^{0}K_{0}=K_{0}$ ; the inductive step is proved by the following sequence of equalities:

$$\begin{split} T_{\mathsf{Eq}_{\rho}}^{n+1} K_0 \, \overline{\mathsf{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}}} &= T_{\mathsf{Eq}_{\rho}}^{\mathsf{Rel}} (T_{\mathsf{Eq}_{\rho}}^{n} K_0) \overline{\mathsf{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}}} \\ &= \llbracket\Gamma;\Phi,\phi,\overline{\alpha}\vdash H\rrbracket^{\mathsf{Rel}} \mathsf{Eq}_{\rho}[\phi:=T_{\mathsf{Eq}_{\rho}}^{n} K_0] \overline{[\alpha:=\mathsf{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}}]} \\ &= \llbracket\Gamma;\Phi,\phi,\overline{\alpha}\vdash H\rrbracket^{\mathsf{Rel}} \mathsf{Eq}_{\rho}[\phi:=\mathsf{Eq}_{(T_{\rho}^{\mathsf{Set}})^{n} K_0}] \overline{[\alpha:=\mathsf{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}}]} \\ &= \llbracket\Gamma;\Phi,\phi,\overline{\alpha}\vdash H\rrbracket^{\mathsf{Rel}} \mathsf{Eq}_{\rho[\phi:=(T_{\rho}^{\mathsf{Set}})^{n} K_0]} \overline{[\alpha:=\llbracket\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}}] \\ &= \mathsf{Eq}_{\llbracket\Gamma;\Phi,\phi,\overline{\alpha}\vdash H\rrbracket}^{\mathsf{Set}_{\rho}} [\phi:=(T_{\rho}^{\mathsf{Set}})^{n} K_0] \overline{[\alpha:=\llbracket\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}}]} \\ &= \mathsf{Eq}_{(T_{\rho}^{\mathsf{Set}})^{n+1} K_0} \overline{[\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}} \\ &= (\mathsf{Eq}_{(T_{\rho}^{\mathsf{Set}})^{n+1} K_0})^* \overline{\mathsf{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket}^{\mathsf{Set}_{\rho}}} \end{split}$$

Here, the third equality is by (5), the fifth by the induction hypothesis on H, and the last by Lemma 24. We prove the induction step of (5) by structural induction on H: the only interesting case, though, is when  $\phi$  is applied, i.e., for  $H = \phi \overline{\sigma}$ , which is proved by the sequence of equalities:

$$\begin{split} & \big[\![\Gamma;\Phi,\phi,\overline{\alpha}\vdash\phi\overline{\sigma}\big]\!]^{\mathrm{Rel}} \mathrm{Eq}_{\rho}[\phi:=T^n_{\mathrm{Eq}_{\rho}}K_0] \overline{\big[\alpha:=\mathrm{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho}\big]} \\ & = T^n_{\mathrm{Eq}_{\rho}}K_0 \overline{\big[\![\Gamma;\Phi,\phi,\overline{\alpha}\vdash\sigma]\!]^{\mathrm{Rel}}} \mathrm{Eq}_{\rho}[\phi:=T^n_{\mathrm{Eq}_{\rho}}K_0] \overline{\big[\![\alpha:=\mathrm{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho}\big]} \\ & = T^n_{\mathrm{Eq}_{\rho}}K_0 \overline{\big[\![\Gamma;\Phi,\phi,\overline{\alpha}\vdash\sigma]\!]^{\mathrm{Rel}}} \mathrm{Eq}_{\rho}[\phi:=\mathrm{Eq}_{(T^{\mathrm{Set}}_{\rho})^nK_0}] \overline{\big[\![\alpha:=\mathrm{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho}\big]} \\ & = T^n_{\mathrm{Eq}_{\rho}}K_0 \overline{\big[\![\Gamma;\Phi,\phi,\overline{\alpha}\vdash\sigma]\!]^{\mathrm{Rel}}} \mathrm{Eq}_{\rho[\phi:=(T^{\mathrm{Set}}_{\rho})^nK_0] \overline{\big[\![\alpha:=\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho]}} \\ & = T^n_{\mathrm{Eq}_{\rho}}K_0 \overline{\big[\![\Gamma;\Phi,\phi,\overline{\alpha}\vdash\sigma]\!]^{\mathrm{Set}}\rho[\phi:=(T^{\mathrm{Set}}_{\rho})^nK_0] \overline{\big[\![\alpha:=\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho]}} \\ & = (\mathrm{Eq}_{(T^{\mathrm{Set}}_{\rho})^nK_0})^* \overline{\mathrm{Eq}_{\llbracket\Gamma;\Phi,\phi,\overline{\alpha}\vdash\sigma\rrbracket^{\mathrm{Set}}\rho[\phi:=(T^{\mathrm{Set}}_{\rho})^nK_0] \overline{\big[\![\alpha:=\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho]}}} \\ & = (\mathrm{Eq}_{(T^{\mathrm{Set}}_{\rho})^nK_0})^* \overline{\big[\![\Gamma;\Phi,\phi,\overline{\alpha}\vdash\sigma\rrbracket]^{\mathrm{Rel}}} \mathrm{Eq}_{\rho}[\phi:=\mathrm{Eq}_{(T^{\mathrm{Set}}_{\rho})^nK_0}] \overline{\big[\![\alpha:=\mathrm{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho]}]}} \\ & = [\Gamma;\Phi,\phi,\overline{\alpha}\vdash\phi\overline{\sigma}]^{\mathrm{Rel}} \mathrm{Eq}_{\rho}[\phi:=\mathrm{Eq}_{(T^{\mathrm{Set}}_{\rho})^nK_0}] \overline{\big[\![\alpha:=\mathrm{Eq}_{\llbracket\Gamma;\Phi\vdash\tau\rrbracket^{\mathrm{Set}}\rho]}]}} \end{split}$$

Here, the second equality is by the induction hypothesis for (5) on the  $\sigma$ s, the fourth is by the induction hypothesis for Theorem 25 on the  $\sigma$ s, and the fifth is by the induction hypothesis on n for (4).

- $\bullet \ \llbracket \Gamma ; \Phi \vdash \sigma + \tau \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\alpha} = \llbracket \Gamma ; \Phi \vdash \sigma \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\alpha} + \llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \sigma \rrbracket^{\mathrm{Set}} \alpha} + \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \sigma \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_{\llbracket \Gamma : \Phi \vdash \tau \rrbracket^{\mathrm{Set}} \alpha} = \mathsf{Eq}_$  $\mathsf{E} \mathsf{q}_{ \llbracket \Gamma ; # INTERPRETING TERMS

If  $\Delta = x_1 : \tau_1, ..., x_n : \tau_n$  is a term context for  $\Gamma$  and  $\Phi$ , then the interpretations  $[\![\Gamma; \Phi \vdash \Delta]\!]^{\mathsf{Set}}$  and  $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{Rel}$  are defined by

$$\begin{array}{lll} \llbracket \Gamma ; \Phi \vdash \Delta \rrbracket^{\operatorname{Set}} & = & \llbracket \Gamma ; \Phi \vdash \tau_1 \rrbracket^{\operatorname{Set}} \times \ldots \times \llbracket \Gamma ; \Phi \vdash \tau_n \rrbracket^{\operatorname{Set}} \\ \llbracket \Gamma ; \Phi \vdash \Delta \rrbracket^{\operatorname{Rel}} & = & \llbracket \Gamma ; \Phi \vdash \tau_1 \rrbracket^{\operatorname{Rel}} \times \ldots \times \llbracket \Gamma ; \Phi \vdash \tau_n \rrbracket^{\operatorname{Rel}} \end{array}$$

1:18 Anon.

Every well-formed term  $\Gamma; \Phi \mid \Delta \vdash t : \tau$  then has a set interpretation  $[\![\Gamma; \Phi \mid \Delta \vdash t : \tau]\!]^{\mathsf{Set}}$  as a natural transformation from  $[\Gamma; \Phi \vdash \Delta]^{\text{Set}}$  to  $[\Gamma; \Phi \vdash \tau]^{\text{Set}}$ , and a relational interpretation  $[\Gamma; \Phi \mid \Delta \vdash t : \tau]^{\text{Rel}}$ as a natural transformation from  $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\text{Rel}}$  to  $\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\text{Rel}}$ . These are given in the next two definitions.

```

 Definition 27. If  $\rho$  is a relation environment and  $\Gamma$ ;  $\Phi \mid \Delta \vdash t : \tau$  then  $[\![\Gamma; \Phi \mid \Delta \vdash t : \tau]\!]^{Rel} \rho$  is defined as follows:

$$\begin{split} & \llbracket \Gamma; \emptyset \mid \Delta, x : \tau \vdash x : \tau \rrbracket^{\text{Rel}} \rho \\ & \llbracket \Gamma; \emptyset \mid \Delta \vdash \lambda x. t : \sigma \to \tau \rrbracket^{\text{Rel}} \rho \\ & \llbracket \Gamma; \emptyset \mid \Delta \vdash st : \tau \rrbracket^{\text{Rel}} \rho \\ & \llbracket \Gamma; \emptyset \mid \Delta \vdash t : \tau \rrbracket^{\text{Rel}} \rho \end{split} \\ & = \operatorname{curry}(\llbracket \Gamma; \emptyset \mid \Delta, x : \sigma \vdash t : \tau \rrbracket^{\text{Rel}} \rho) \\ & = \operatorname{curry}(\llbracket \Gamma; \emptyset \mid \Delta \vdash s : \sigma \to \tau \rrbracket^{\text{Rel}} \rho, \llbracket \Gamma; \emptyset \mid \Delta \vdash t : \sigma \rrbracket^{\text{Rel}} \rho) \\ & \llbracket \Gamma; \emptyset \mid \Delta \vdash t : \operatorname{Rat}^{\overline{\alpha}} FG \rrbracket^{\text{Rel}} \rho \end{split} \\ & = \operatorname{curry}(\llbracket \Gamma; \overline{\alpha} \mid \Delta, x : F \vdash t : G \rrbracket^{\text{Rel}} \rho [\overline{\alpha} := \underline{-}]) \\ & = \operatorname{eval} \circ \langle (\llbracket \Gamma; \emptyset \mid \Delta \vdash t : \operatorname{Nat}^{\overline{\alpha}} FG \rrbracket^{\text{Rel}} \rho) \underline{\Gamma}^{\text{Rel}} \rho, \end{split}$$

If t is closed, i.e., if  $\emptyset$ ;  $\emptyset \mid \emptyset \vdash t : \tau$ , then we write  $[t : \tau]^{Set}$  instead of  $[0; \emptyset \mid \emptyset \vdash t : \tau]^{Set}$ , and similarly for  $[0; \emptyset \mid \emptyset \vdash t : \tau]^{Rel}$ .

 $[\Gamma; \emptyset \mid \Delta \vdash \text{fold}_{H,F} t : \text{Nat}^{\overline{\alpha}}((\mu \phi. \lambda \overline{\beta}. H) \overline{\alpha}) F]^{\text{Rel}} \rho = \text{fold} \circ [\Gamma; \emptyset \mid \Delta \vdash t : \text{Nat}^{\overline{\alpha}}(H[\phi := F][\overline{\beta} := \alpha]) F]^{\text{Rel}} \rho$ 

Lemma 28. We have that, for any set environment  $\rho$  and morphism of set environments  $f: \rho \to \rho'$ 

• for  $\Gamma$ ;  $\Phi$ ,  $\alpha \vdash F$  and  $\Gamma$ ;  $\Phi \vdash \tau$ ,

 $\llbracket \Gamma; \Phi \mid \Delta \vdash \text{in } t : (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket^{\text{Rel}} \rho$ 

$$\llbracket \Gamma; \Phi \vdash F[\alpha := \tau] \rrbracket^{\operatorname{Set}} \rho = \llbracket \Gamma; \Phi, \alpha \vdash F \rrbracket^{\operatorname{Set}} \rho [\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho] \tag{6}$$

 $in \circ \llbracket \Gamma; \Phi \mid \Delta \vdash t : H[\phi := \mu \phi. \lambda \overline{\alpha}. H][\overline{\alpha := \tau}] \rrbracket^{\text{Rel}} \rho$ 

and

$$\llbracket \Gamma; \Phi \vdash F[\alpha := \tau] \rrbracket^{\mathsf{Set}} f = \llbracket \Gamma; \Phi, \alpha \vdash F \rrbracket^{\mathsf{Set}} f[\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} f] \tag{7}$$

• for  $\Gamma$ ;  $\Phi$ ,  $\phi^k \vdash F$  and  $\Gamma$ ;  $\Phi$ ,  $\alpha_1 ... \alpha_k \vdash H$ ,

$$\llbracket \Gamma; \Phi \vdash F[\phi := H] \rrbracket^{\mathsf{Set}} \rho = \llbracket \Gamma; \Phi, \phi \vdash F \rrbracket^{\mathsf{Set}} \rho [\phi := \llbracket \Gamma; \Phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Set}} \rho [\overline{\alpha} := -]] \tag{8}$$

and

$$\llbracket \Gamma; \Phi \vdash F[\phi := H] \rrbracket^{\mathsf{Set}} f = \llbracket \Gamma; \Phi, \phi \vdash F \rrbracket^{\mathsf{Set}} f[\phi := \llbracket \Gamma; \Phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Set}} f[\overline{\alpha := -}]$$
 (9)

Analogous identities hold for the relational interpretation.

ISSUE: the substitution  $[\phi := H]$  should specify that the  $\alpha$ s in H correspond to the arguments of  $\phi$ . For example, we could write  $[\phi :=_{\alpha} H]$ . Also add  $\overline{\alpha}$  notation to Definition 4.

1:20 Anon.

PROOF. The proofs for the set interpretation and those for the relational interpretation are completely analogous, so we shall just give the formers. Likewise, we shall only prove equations 6 and 8, as the proofs for equations 7 and 9 are analogous.

Although equation 6 is a special case of equation 8, it is convenient to prove it first, and then use that to prove equation 8.

We proceed by induction on the structure of F.

- *F* :  $\mathcal{T}$  does not contain any type constructor variable to replace, so there is nothing to prove.
- F = 1, 0 do not contain any type constructor variable to replace, so there is nothing to prove.
- for  $F = F_1 \times F_2$ ,  $F_1 + F_2$ , the substitution distributes over the product/sum and it then suffices to apply the induction hypothesis.
- for  $F = \beta$  with  $\beta \neq \alpha$ , there is nothing to prove.
- for  $F = \alpha$ , we have

$$\llbracket \Gamma ; \Phi \vdash \alpha [\alpha := \tau] \rrbracket^{\mathsf{Set}} \rho = \llbracket \Gamma ; \Phi , \alpha \vdash \alpha \rrbracket^{\mathsf{Set}} \rho [\alpha := \llbracket \Gamma ; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho]$$

as both are equal to  $\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho$ .

• for  $F = \phi \overline{\sigma}$  with  $\phi \neq \alpha$ , we have that

$$\begin{split} \llbracket \Gamma; \Phi \vdash (\phi \overline{\sigma}) \llbracket \alpha &:= \tau \rrbracket \rrbracket^{\operatorname{Set}} \rho = \llbracket \Gamma; \Phi \vdash \phi(\overline{\sigma[\alpha := \tau]}) \rrbracket^{\operatorname{Set}} \rho \\ &= (\rho \phi) \overline{\llbracket \Gamma; \Phi \vdash \sigma[\alpha := \tau] \rrbracket^{\operatorname{Set}} \rho} \\ &= (\rho \phi) \overline{\llbracket \Gamma; \Phi, \alpha \vdash \sigma \rrbracket^{\operatorname{Set}} \rho[\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}}]} \\ &= \llbracket \Gamma; \Phi, \alpha \vdash \phi \overline{\sigma} \rrbracket^{\operatorname{Set}} \rho[\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}}] \end{split}$$

where the third equality is by the induction hypothesis.

• for  $F = (\mu \psi . \lambda \overline{\beta} . K) \overline{\sigma}$  we have that

$$\begin{split} & \llbracket \Gamma; \Phi \vdash ((\mu \psi. \lambda \overline{\beta}.K) \overline{\sigma}) [\alpha := \tau] \rrbracket^{\operatorname{Set}} \rho \\ & = \llbracket \Gamma; \Phi \vdash (\mu \psi. \lambda \overline{\beta}.K [\alpha := \tau]) (\overline{\sigma[\alpha := \tau]}) \rrbracket^{\operatorname{Set}} \rho \\ & = \mu (\llbracket \Gamma; \Phi, \psi, \overline{\beta} \vdash K [\alpha := \tau] \rrbracket^{\operatorname{Set}} \rho [\psi := -] [\overline{\beta} := -]) (\overline{\llbracket \Gamma; \Phi \vdash \sigma[\alpha := \tau]} \underline{\rrbracket^{\operatorname{Set}} \rho}) \\ & = \mu (\llbracket \Gamma; \Phi, \psi, \overline{\beta}, \alpha \vdash K \rrbracket^{\operatorname{Set}} \rho [\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho] [\psi := -] [\overline{\beta} := -]) \\ & (\overline{\llbracket \Gamma; \Phi, \alpha \vdash \sigma \rrbracket^{\operatorname{Set}}} \rho [\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho]) \\ & = \llbracket \Gamma; \Phi, \alpha \vdash (\mu \psi. \lambda \overline{\beta}.K) \overline{\sigma} \rrbracket^{\operatorname{Set}} \rho [\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho] \end{split}$$

where the third equality is by the induction hypothesis.

We prove equation 8. We proceed by induction on the structure of *F*.

- $F: \mathcal{T}$  does not contain any type constructor variable to replace, so there is nothing to prove.
- $F = \mathbb{1}, \mathbb{0}$  do not contain any type constructor variable to replace, so there is nothing to prove.
- for  $F = F_1 \times F_2$ ,  $F_1 + F_2$ , the substitution distributes over the product/sum and it then suffices to apply the induction hypothesis.

 • for  $F = \phi \overline{\tau}$ , we have that

$$\begin{split} & \llbracket \Gamma; \Phi \vdash (\phi \overline{\tau}) \llbracket \phi := H \rrbracket \rrbracket^{\operatorname{Set}} \rho \\ &= \llbracket \Gamma; \Phi \vdash H \llbracket \overline{\alpha} := \tau \llbracket \phi := H \rrbracket \rrbracket \rrbracket \rrbracket^{\operatorname{Set}} \rho \\ &= \llbracket \Gamma; \Phi \vdash H \rrbracket^{\operatorname{Set}} \rho \llbracket \overline{\alpha} := \llbracket \Gamma; \Phi \vdash \tau \llbracket \phi := H \rrbracket \rrbracket^{\operatorname{Set}} \rho \rrbracket \\ &= \llbracket \Gamma; \Phi \vdash H \rrbracket^{\operatorname{Set}} \rho \llbracket \overline{\alpha} := \llbracket \Gamma; \Phi, \phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho \llbracket \phi := \llbracket \Gamma; \Phi, \overline{\alpha} \vdash H \rrbracket^{\operatorname{Set}} \rho \llbracket \overline{\alpha} := - \rrbracket \rrbracket \rrbracket \rrbracket \\ &= \llbracket \Gamma; \Phi, \phi \vdash \phi \overline{\tau} \rrbracket^{\operatorname{Set}} \rho \llbracket \phi := \llbracket \Gamma; \Phi, \overline{\alpha} \vdash H \rrbracket^{\operatorname{Set}} \rho \llbracket \overline{\alpha} := - \rrbracket \rrbracket \rrbracket \end{split}$$

where the second equality is for equation 6, and the third equality is by the induction hypothesis.

- for  $F = \psi \overline{\tau}$  with  $\psi \neq \phi$ , we have a case similar to the previous one but simpler, as  $\phi$  only needs to be substituted in the arguments  $\tau$  of  $\psi$ .
- for  $F = (\mu \psi . \lambda \overline{\beta} . K) \overline{\tau}$  we have that

$$\begin{split} & \llbracket \Gamma; \Phi \vdash ((\mu \psi. \lambda \overline{\beta}.K) \overline{\tau}) \llbracket \phi := H \rrbracket \rrbracket^{\operatorname{Set}} \rho \\ &= \llbracket \Gamma; \Phi \vdash (\mu \psi. \lambda \overline{\beta}.K \llbracket \phi := H \rrbracket) (\overline{\tau \llbracket \phi := H \rrbracket}) \rrbracket^{\operatorname{Set}} \rho \\ &= \mu (\llbracket \Gamma; \Phi, \psi, \overline{\beta} \vdash K \llbracket \phi := H \rrbracket) \rrbracket^{\operatorname{Set}} \rho \llbracket \psi := - \rrbracket [\overline{\beta} := - \rrbracket) (\overline{\llbracket \Gamma; \Phi \vdash \tau \llbracket \phi := H \rrbracket} ]^{\operatorname{Set}} \rho) \\ &= \mu (\llbracket \Gamma; \Phi, \psi, \overline{\beta}, \phi \vdash K \rrbracket^{\operatorname{Set}} \rho \llbracket \phi := \llbracket \Gamma; \Phi, \overline{\alpha} \vdash H \rrbracket^{\operatorname{Set}} \rho \llbracket \overline{\alpha} := - \rrbracket) \llbracket \psi := - \rrbracket [\overline{\beta} := - \rrbracket) ) \\ &\qquad (\overline{\llbracket \Gamma; \Phi, \phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho \llbracket \phi := \llbracket \Gamma; \Phi, \overline{\alpha} \vdash H \rrbracket^{\operatorname{Set}} \rho \llbracket \overline{\alpha} := - \rrbracket]}) \\ &= \llbracket \Gamma; \Phi, \phi \vdash (\mu \psi. \lambda \overline{\beta}.K) \overline{\tau} \rrbracket^{\operatorname{Set}} \rho \llbracket \phi := \llbracket \Gamma; \Phi, \overline{\alpha} \vdash H \rrbracket^{\operatorname{Set}} \rho \llbracket \overline{\alpha} := - \rrbracket] \end{split}$$

where the third equality is by the induction hypothesis.

The set and relation interpretations of every well-formed term are well-defined, and are actually natural transformations.

Lemma 29. For every well-formed term  $\Gamma; \Phi \mid \Delta \vdash t : \tau$ , its set interpretation  $\llbracket \Gamma; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\operatorname{Set}}$  is a well-defined natural transformation from  $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\operatorname{Set}}$  to  $\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}}$ , i.e., for every set environment  $\rho$ , it yields a function from  $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\operatorname{Set}} \rho$  to  $\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Set}} \rho$ . Similarly, its relational interpretation  $\llbracket \Gamma; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\operatorname{Rel}}$  is a well-defined natural transformation from  $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\operatorname{Rel}}$  to  $\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Rel}}$ , i.e., for every relation environment  $\rho$ , it yields a map of relations from  $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\operatorname{Rel}} \rho$  to  $\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\operatorname{Rel}} \rho$ .

We will need to know that type interpretations respect type substitution. That's what all these little lemmas will establish. We will also ultimately want to know that term interpretations respect type substitution, and that term interpretations respect term substitution.

PROOF. We proceed by structural induction, and we only show the interesting cases.

• We show that  $\llbracket \Gamma; \emptyset \mid \Delta \vdash L_{\overline{\alpha}} x.t : \operatorname{Nat}^{\overline{\alpha}} FG \rrbracket^{\operatorname{Set}} \rho$  is well-defined. Given  $d \in \llbracket \Gamma; \emptyset \vdash \Delta \rrbracket^{\operatorname{Set}}$  and  $\overline{A : \operatorname{Set}}$ , let

$$\eta_{\overline{A}} = \operatorname{curry}(\llbracket \Gamma; \overline{\alpha} \mid \Delta, x : F \vdash t : G \rrbracket^{\operatorname{Set}} \rho[\overline{\alpha := A}]) d$$

Then, for any  $z \in \llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^{\mathsf{Set}} \rho[\overline{\alpha := A}]$ , we have that

$$\eta_{\overline{A}}z = [\![\Gamma; \overline{\alpha} \mid \Delta, x : F \vdash t : G]\!]^{\operatorname{Set}} \rho \overline{[\alpha := A]}(d, z) \in [\![\Gamma; \overline{\alpha} \vdash G]\!]^{\operatorname{Set}} \rho \overline{[\alpha := A]}$$

Thus, for all  $\overline{R: \mathsf{Rel}(A,B)}$ , if  $(x,y) \in \llbracket \Gamma; \overline{\alpha} \vdash F \rrbracket^\mathsf{Rel} \mathsf{Eq}_{\rho}[\overline{\alpha:=R}]$ , then

$$((d,x),(d,y)) \in [\![\Gamma;\overline{\alpha}\vdash \Delta,F]\!]^{\mathsf{Rel}}\mathsf{Eq}_{\rho}[\overline{\alpha:=R}]$$

1:22 Anon.

Observe that, by the induction hypothesis on the term t,

$$\llbracket \Gamma; \overline{\alpha} \mid \Delta, x : F \vdash t : G \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\rho}[\overline{\alpha := R}] : \llbracket \Gamma; \overline{\alpha} \vdash \Delta, F \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\rho}[\overline{\alpha := R}] \to \llbracket \Gamma; \overline{\alpha} \vdash G \rrbracket^{\mathrm{Rel}} \mathsf{Eq}_{\rho}[\overline{\alpha := R}]$$
 and thus

$$(\eta_{\overline{A}}x, \eta_{\overline{R}}y) \in \llbracket\Gamma; \overline{\alpha} \vdash G\rrbracket^{\mathsf{Rel}}\mathsf{Eq}_{\alpha}[\overline{\alpha} := R]$$

Naturality of  $\llbracket \Gamma; \emptyset \mid \Delta \vdash L_{\overline{\alpha}}x.t : \operatorname{Nat}^{\overline{\alpha}} FG \rrbracket^{\operatorname{Set}}$  follows from the fact that the currying of a natural transformation is still a natural transformation.

• We show that  $[\![\Gamma;\emptyset\mid\Delta\vdash L_{\overline{\alpha}}x.t:\operatorname{Nat}^{\overline{\alpha}}FG]\!]^{\operatorname{Rel}}\rho$  is well-defined. Given  $(d_1,d_2)\in [\![\Gamma;\emptyset\vdash\Delta]\!]^{\operatorname{Rel}}\rho$ , we want to show that

$$\operatorname{curry}(\llbracket\Gamma; \overline{\alpha} \mid \Delta, x : F \vdash t : G\rrbracket^{\operatorname{Rel}} \rho[\overline{\alpha := \_}])(d_1, d_2)$$

is in  $[\![\Gamma;\emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} FG]\!]^{\mathsf{Rel}} \rho$ . For every  $\overline{R:\mathsf{Rel}(A,B)}$ , if  $(x_1,x_2) \in [\![\Gamma;\overline{\alpha} \vdash F]\!]^{\mathsf{Rel}} \rho[\overline{\alpha}:=R]$ , then

$$\operatorname{curry}(\llbracket\Gamma;\overline{\alpha}\mid\Delta,x:F\vdash t:G\rrbracket^{\operatorname{Rel}}\rho[\overline{\alpha:=\_}])(d_1,d_2))_{\overline{R}}(x_1,x_2)$$

is equal to

$$\llbracket \Gamma; \overline{\alpha} \mid \Delta, x : F \vdash t : G \rrbracket^{\text{Rel}} \rho [\overline{\alpha} := R] ((d_1, x_1), (d_2, x_2))$$

and

$$((d_1,x_1),(d_2,x_2)) \in \llbracket \Gamma; \overline{\alpha} \vdash \Delta, F \rrbracket^{\mathsf{Rel}} \rho[\overline{\alpha:=R}]$$

By the induction hypothesis on the term t,  $[\![\Gamma; \overline{\alpha} \mid \Delta, x : F \vdash t : G]\!]^{Rel} \rho[\overline{\alpha} := R]$  is a morphism in Rel from  $[\![\Gamma; \overline{\alpha} \vdash \Delta, F]\!]^{Rel} \rho[\overline{\alpha} := R]$  to  $[\![\Gamma; \overline{\alpha} \vdash G]\!]^{Rel} \rho[\overline{\alpha} := R]$  and thus

$$\operatorname{curry}(\llbracket\Gamma;\overline{\alpha}\mid\Delta,x:F\vdash t:G\rrbracket^{\operatorname{Rel}}\rho[\overline{\alpha:=\_}])(d_1,d_2))_{\overline{R}}(x_1,x_2)\in\llbracket\Gamma;\overline{\alpha}\vdash G\rrbracket^{\operatorname{Rel}}\rho[\overline{\alpha:=R}]$$

Naturality of  $\llbracket \Gamma; \emptyset \mid \Delta \vdash L_{\overline{\alpha}}x.t : \operatorname{Nat}^{\overline{\alpha}} FG \rrbracket^{\operatorname{Rel}}$  follows from the fact that the currying of a natural transformation is still a natural transformation.

• To define  $\llbracket \Gamma; \Phi \mid \Delta \vdash \text{ in } t : (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket^{\text{Set}} \rho$  we need Lemma 28 to show that

$$\llbracket \Gamma; \Phi \vdash H \llbracket \phi := \mu \phi. \lambda \overline{\alpha}.H \rrbracket \llbracket \overline{\alpha} := \overline{\tau} \rrbracket \rrbracket^{\mathsf{Set}} \rho = \llbracket \Gamma; \Phi, \phi, \overline{\alpha} \vdash H \rrbracket^{\mathsf{Set}} \rho \llbracket \phi := \mu T_{\sigma}^{\mathsf{Set}} \rrbracket \llbracket \overline{\alpha} := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} \rho \rrbracket$$

Then, we can define it as

 Naturality of  $\llbracket \Gamma; \Phi \mid \Delta \vdash \text{in } t : (\mu \phi. \lambda \overline{\alpha}. H) \overline{\tau} \rrbracket^{\text{Set}}$  follows from the naturality of in with respect to the set arguments to the functor. Indeed, the diagram

commutes for any morphism of set environments  $f: \rho \to \rho'$ .

We proceed analogously to show that the relational interpretation of the same term is well-defined.

• For the fold case, we shall check only the set interpretation, since the relational interpretation is defined analogously.  $\llbracket \Gamma; \emptyset \mid \Delta \vdash \mathsf{fold}_{H,F} \ t : \mathsf{Nat}^{\overline{\alpha}} ((\mu \phi. \lambda \overline{\beta}. H) \overline{\alpha}) \ F \rrbracket^\mathsf{Set} \rho$  is defined as

$$\begin{split} \llbracket \Gamma; \emptyset \vdash \Delta \rrbracket^{\mathsf{Set}} \rho \\ & \qquad \qquad \bigcup_{\llbracket \Gamma; \emptyset \mid \Delta \vdash t : \mathsf{Nat}^{\overline{\alpha}} \left( H[\phi := F][\overline{\beta} := \overline{\alpha}] \right) F \rrbracket^{\mathsf{Set}} \rho \\ \llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} \left( H[\phi := F][\overline{\beta} := \overline{\alpha}] \right) F \rrbracket^{\mathsf{Set}} \rho \\ & \qquad \qquad \bigcup_{fold}^{fold} \\ \llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} \left( (\mu \phi. \lambda \overline{\beta}. H) \overline{\alpha} \right) F \rrbracket^{\mathsf{Set}} \rho \end{split}$$

We want to show that fold is well defined. Let  $\eta \in \llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} (H[\phi := F][\overline{\beta := \alpha}]) F \rrbracket^{\mathsf{Set}} \rho$ . For all  $\overline{R} : \mathsf{Set}(A, B)$ , we have that  $\eta_{\overline{R}}$  is a morphism in Set. Then  $(fold \ \eta)_{\overline{R}} = fold \ \eta_{\overline{R}}$  is too, meaning that  $fold \ \eta$  belongs to  $\llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} ((\mu \phi. \lambda \overline{\beta}. H) \overline{\alpha}) F \rrbracket^{\mathsf{Set}} \rho$ .

Naturality of *fold* follows from the fact that, because of the assumption  $\Gamma; \phi, \overline{\beta} \vdash H$ , we have that  $T_{\rho} = T_{\rho'}$  and  $T_{f} = Id$  for every morphism of environments  $f: \rho \to \rho'$ . Then,  $\llbracket \Gamma; \emptyset \mid \Delta \vdash \mathsf{fold}_{H,F} \ t : \mathsf{Nat}^{\overline{\alpha}} ((\mu \phi. \lambda \overline{\beta}. H) \overline{\alpha}) F \rrbracket^\mathsf{Set}$  is natural.

• To define  $[\Gamma; \Phi \mid \Delta \vdash t_{\overline{\tau}}s : G[\overline{\alpha := \tau}]]^{Set}\rho$  we need Lemma 28 to show that

$$(\llbracket\Gamma; \overline{\alpha} \vdash F\rrbracket)^{\operatorname{Set}} \rho [\overline{\alpha} := \llbracket\Gamma; \Phi \vdash \tau\rrbracket)^{\operatorname{Set}} \rho] \to \llbracket\Gamma; \overline{\alpha} \vdash G\rrbracket)^{\operatorname{Set}} \rho [\overline{\alpha} := \llbracket\Gamma; \Phi \vdash \tau\rrbracket)^{\operatorname{Set}} \rho]) \times \llbracket\Gamma; \Phi \vdash F[\overline{\alpha} := \tau]]^{\operatorname{Set}} \rho$$

$$= (\llbracket\Gamma; \Phi \vdash F[\overline{\alpha} := \tau]]^{\operatorname{Set}} \rho \to \llbracket\Gamma; \Phi \vdash G[\overline{\alpha} := \tau]]^{\operatorname{Set}} \rho) \times \llbracket\Gamma; \Phi \vdash F[\overline{\alpha} := \tau]]^{\operatorname{Set}} \rho \quad (10)$$

1:24 Anon.

Then, using this fact in the third step below, we define it as

Naturality entails that, for every  $f: \rho \to \rho'$  morphism of environments,  $\phi \in \llbracket \Gamma; \emptyset \vdash \mathsf{Nat}^{\overline{\alpha}} FG \rrbracket^{\mathsf{Set}} \rho$  and  $x \in \llbracket \Gamma; \Phi \vdash F[\overline{\alpha} := \overline{\tau}] \rrbracket^{\mathsf{Set}} \rho$ , we have

$$\llbracket \Gamma ; \Phi \vdash G[\overline{\alpha := \tau}] \rrbracket^{\mathsf{Set}} f(\phi_{\overline{\lVert \Gamma \cdot \Phi \vdash \tau \rVert \alpha}} x) = \phi_{\overline{\lVert \Gamma \cdot \Phi \vdash \tau \rVert \alpha'}} (\llbracket \Gamma ; \Phi \vdash F[\overline{\alpha := \tau}] \rrbracket^{\mathsf{Set}} f x)$$

which, abstracting over x and using Lemma 28, is equivalent to

$$\llbracket \Gamma; \Phi, \overline{\alpha} \vdash G \rrbracket^{\mathsf{Set}} f [\overline{\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} f}] \circ \phi_{\overline{\lVert \Gamma; \Phi \vdash \tau \rVert \rho}} = \phi_{\overline{\lVert \Gamma; \Phi \vdash \tau \rVert \rho'}} \circ \llbracket \Gamma; \Phi, \overline{\alpha} \vdash F \rrbracket^{\mathsf{Set}} f [\overline{\alpha := \llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} f}]$$

which is true by naturality of  $\phi$  applied to the morphism  $\overline{\llbracket \Gamma; \Phi \vdash \tau \rrbracket^{\mathsf{Set}} f}$ .

We proceed analogously to define the relational interpretation of the same term.  $\Box$ 

#### 4.1 The Abstraction Theorem

Since the Abstraction Theorem is a special case of soundness of the interpretation, it follows from Lemma 29. Indeed, we first observe that, by Lemma 21, ( $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\text{Set}}, \llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\text{Set}}, \llbracket \Gamma; \Phi \vdash \Delta \rrbracket^{\text{Rel}}$ ) is a functor from RelEnv to  $RT_0$ , which we denote by  $\llbracket \Gamma; \Phi \vdash \Delta \rrbracket$ . We then have:

Theorem 30. Every well-formed term  $\Gamma; \Phi \mid \Delta \vdash t : \tau$  induces a natural transformation from  $[\Gamma; \Phi \vdash \Delta]$  to  $[\Gamma; \Phi \vdash \tau]$ , i.e., a triple of natural transformations

$$(\llbracket \Gamma ; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Set}}, \llbracket \Gamma ; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Set}}, \llbracket \Gamma ; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Rel}})$$

*such that, for all*  $\rho$  : RelEnv,

$$\llbracket \Gamma; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Rel}} \rho = (\llbracket \Gamma; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Set}}(\pi_1 \rho), \llbracket \Gamma; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Set}}(\pi_2 \rho))$$

**PROOF.** We proceed by induction on the judgement  $\Gamma$ ;  $\Phi \mid \Delta \vdash t : \tau$ , proving that

$$\pi_i(\llbracket \Gamma; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Rel}} \rho) = \llbracket \Gamma; \Phi \mid \Delta \vdash t : \tau \rrbracket^{\mathsf{Set}}(\pi_i \rho)$$

for i = 1, 2. We will use Definitions 26 and 27, together with the facts that the cartesian structure of Rel is derived from that of Set and that initial algebras in Rel are computed in terms of initial algebras in Set.

```

We now show that the interpretation given in Sections 3.1, 3.2, and 4 define a logical relation. Indeed, the Abstraction Theorem is the special case of Theorem 30 for closed terms.

```
Theorem 31. If \vdash \tau : \mathcal{F} and \vdash t : \tau, then (\llbracket t : \tau \rrbracket^{\mathsf{Set}}, \llbracket t : \tau \rrbracket^{\mathsf{Set}}) \in \llbracket \tau \rrbracket^{\mathsf{Rel}}.
```

DEFINITION 32. Let  $\Gamma; \Phi, \alpha \mid \Delta \vdash t : \tau$  be a term and  $\Gamma; \Phi \vdash \sigma : \mathcal{F}$  be a type. Then, we define by induction on t a term  $\Gamma; \Phi \mid \Delta[\alpha := \sigma] \vdash t[\alpha := \sigma] : \tau[\alpha := \sigma]$  as

```
x[\alpha := \sigma] = x
(\lambda x.t)[\alpha := \sigma] = \lambda x.(t[\alpha := \sigma])
(st)[\alpha := \sigma] = (s[\alpha := \sigma])(t[\alpha := \sigma])
(L_{\overline{\alpha}}x.t)[\beta := \sigma] = L_{\overline{\alpha}}x.(t[\beta := \sigma])
(t_{\overline{\tau}}s)[\alpha := \sigma] = t_{\overline{\tau}[\alpha := \sigma]}(s[\alpha := \sigma])
(t_{\overline{\tau}}t)[\alpha := \sigma] = t_{\tau[\alpha := \sigma]}(t[\alpha := \sigma])
T[\alpha := \sigma] = T
(s,t)[\alpha := \sigma] = (s[\alpha := \sigma], t[\alpha := \sigma])
(\pi_1t)[\alpha := \sigma] = \pi_1(t[\alpha := \sigma])
(\pi_2t)[\alpha := \sigma] = \pi_2(t[\alpha := \sigma])
(\cos t \text{ of } \{x \mapsto l; y \mapsto r\})[\alpha := \sigma] = \operatorname{case} t[\alpha := \sigma] \text{ of } \{x \mapsto l[\alpha := \sigma]; y \mapsto r[\alpha := \sigma]\}
(\operatorname{int} s)[\alpha := \sigma] = \operatorname{int} (s[\alpha := \sigma])
(\operatorname{int} s)[\alpha := \sigma] = \operatorname{int} (s[\alpha := \sigma])
(\operatorname{int} t)[\alpha := \sigma] = \operatorname{int} (t[\alpha := \sigma])
(\operatorname{fold}_{H,F} t)[\alpha := \sigma] = \operatorname{fold}_{H[\alpha := \sigma],F} (t[\alpha := \sigma])
```

LEMMA 33.

PROOF. By induction on  $\Gamma$ ;  $\Phi$ ,  $\alpha \mid \Delta \vdash t : \tau$ 

1:28 Anon.

```

We will need to go back and add typing rules for well-formed terms involving  $\mathsf{map}^{\mathcal{F}}$  and  $\mathsf{map}^{\mathcal{T}}$  in Def 5, set and relational interpretations of these maps (just the actual functorial actions), and cases for map to all of our proofs thus far having to do with terms.

Next we will want to sanity-check our model by showing that term interps respect conversion rules. These are

- case inl t of  $\{x_1 \mapsto t_1; x_2 \mapsto t_2\} = t_i[x_i := t]$ 
  - and other conversion rules as on page 18 of MFPS paper
  - perhaps add weakening rules explicitly here?
  - All of the above are shorthands for saying that the interps of the LHSs are the same as the interps of the RHSs. For this conversion rule: fold k (in t) = k (map (fold k) t), we can't express it in syntax. So what we really want to say here is that some semantic equivalent of this syntacic rule holds. And similarly for the next rules.
  - Maybe we want to show that ( $[\mu\alpha.F[\alpha]]$ , [in]) is an initial [F]-algebra in the model? See Birkedal and Mogelberg Section 5.4. As part of this we would have the next bullet point, plus some other intermediate results as in 5.17, 5.18, and 5.19 there. We would also need representations of map functions. Perhaps we can define them syntactically as in Plotkin and Abadi section 2.1? (But isn't this precisely what we tried?)
  - fold<sub>H</sub> in<sub>H</sub>x = x (Intuitively, this is the syntactic counterpart to initiality of in.)
  - $\operatorname{\mathsf{map}}_H^{\mathcal{F}}(\overline{L_{\alpha}x.x}) = L_{\bigcup \alpha}x.x$  for all H
  - $\bullet \ \operatorname{map}_H^{\widehat{\mathcal{F}}}(\overline{L_{\alpha}x.\eta_{\alpha}(\mu_{\alpha}x)}) = L_{\bigcup\,\alpha}x.(\operatorname{map}_H^{\mathcal{F}}\overline{\eta})_{\bigcup\,\alpha}((\operatorname{map}_H^{\mathcal{F}}\overline{\mu})_{\bigcup\,\alpha}x)$
  - $\lambda x. \operatorname{map}_G^{\mathcal{F}} \overline{f} (\eta_{\overline{\sigma}} x) = \lambda x. \eta_{\overline{\tau}} (\operatorname{map}_F^{\mathcal{F}} \overline{f} x)$ (note that  $... \vdash f : \operatorname{Nat}^{\emptyset} FG$ )
  - $\operatorname{map}_{H}^{\mathcal{F}}(\overline{\operatorname{map}_{K_{i}}^{\mathcal{F}}\overline{t_{i}}}) = \operatorname{map}_{H[\overline{\psi}:=K]}^{\mathcal{F}}\overline{t}$
  - $\operatorname{map}_{\phi}^{\mathcal{F}} \eta = \eta$

Note that there are no computation rules for types because types are always fully applied in our syntax.

Show  $[\![\Gamma;\emptyset \vdash \sigma \to \tau]\!] = [\![\Gamma;\emptyset \vdash \mathsf{Nat}^{\emptyset} \sigma \tau]\!]$ . Oh, this doesn't appear to hold. Unfolding the definitions, the latter appears to impose a commutativity condition  $([\![\Gamma \vdash \tau]\!]^{\mathsf{Rel}}(\mathsf{Eq}\,\rho) \circ \eta = \eta \circ [\![\Gamma \vdash \sigma]\!]^{\mathsf{Rel}}(\mathsf{Eq}\,\rho)$  that the former does not require.

Other sanity checks?

1:30 Anon.

Note that our calculus does not support Church encodings of data types like pair or sum or list types because all of the "forall"s in our calculus must be at the top level. Nevertheless, our calculus does admit actual sum and product and list types because they are coded by  $\mu$ -terms in our calculus. We just don't have an equivalence of these types and their Church encodings in our calculus, that's all.

#### 5 FREE THEOREMS FOR NESTED TYPES

We can use the results of Section 4.1 to prove interesting results about nested types. To this end, let  $\alpha_i$  have arity  $n_i$  for i = 1, ..., k, and suppose further that  $\emptyset$ ;  $\boldsymbol{\alpha} \vdash E : \mathcal{F}$ , that  $F = \lambda \boldsymbol{A} . \llbracket \emptyset ; \boldsymbol{\alpha} \vdash E \rrbracket^{\text{Set}} \llbracket \boldsymbol{\alpha} := \boldsymbol{A} \rrbracket$ , and that  $F^* = \lambda \boldsymbol{R} . \llbracket \emptyset ; \boldsymbol{\alpha} \vdash E \rrbracket^{\text{Rel}} \llbracket \boldsymbol{\alpha} := \boldsymbol{R} \rrbracket$ .

The next proposition is the only place where we use the syntactic structure of *E*. Propagate contexts?

PROPOSITION 36.  $If(\beta_i, \gamma_i) \in \operatorname{Hom}_{\operatorname{Rel}^{n_i}}(R_i, R'_i) \text{ for } i = 1, ..., k, \text{ then } (F \beta, F \gamma) \in \operatorname{Hom}_{\operatorname{Rel}}(F^*R, F^*R').$ 

PROOF. By induction on the structure of *E*.

- If  $\emptyset$ ;  $\alpha \vdash E : \mathcal{T}$ , then the functor F is constant in  $\alpha$ . Since F therefore maps every morphism in Set to id, we need only show that  $(id, id) \in \mathsf{Hom}_{\mathsf{Rel}}(F^*R, F^*R')$  for all R and R'. But since the functor  $F^*$  is also constant in  $\alpha$ , this holds trivially.
- $E = \mathbb{O}$ . Similar to previous case.
- E = 1. Similar to previous case.
- $E = E_1 * E_2$ . If  $R : \operatorname{Rel}(A, B)$ ,  $R' : \operatorname{Rel}(A', B')$ ,  $(\beta, \gamma) \in \operatorname{Hom}_{\operatorname{Rel}^n}(R, R')$ , and  $(x, y) \in \mathbb{E}[\mathbb{E}]^{\operatorname{Rel}}[\alpha := R]$ , then  $x \in \mathbb{F}[\mathbb{E}]^{\operatorname{Set}}[\alpha := A]$  and  $y \in \mathbb{E}[\mathbb{E}]^{\operatorname{Set}}[\alpha := B]$ , so  $x = (x_1, x_2)$  where  $x_i \in [0; \alpha \vdash E_i]^{\operatorname{Set}}[\alpha := A]$  and  $y = (y_1, y_2)$  where  $y_i \in [E_i]^{\operatorname{Set}}[\alpha := B]$ . Therefore  $(x_1, y_1) \in [0; \alpha \vdash E_1]^{\operatorname{Rel}}[\alpha := R]$  and  $(x_2, y_2) \in [E_2]^{\operatorname{Rel}}[\alpha := R]$ . Using the induction hypothesis twice we get that  $([E_1]^{\operatorname{Set}}\beta x_1, [E_1]^{\operatorname{Set}}\gamma y_1) \in [E_1]^{\operatorname{Rel}}[\alpha := R']$  and  $([E_2]^{\operatorname{Set}}\beta x_2, [E_2]^{\operatorname{Set}}\gamma y_2) \in [E_2]^{\operatorname{Rel}}[\alpha := R']$ , i.e.,  $(([E_1]^{\operatorname{Set}}\beta x_1, [E_2]^{\operatorname{Set}}\beta x_2), ([E_1]^{\operatorname{Set}}\gamma y_1, [E_2]^{\operatorname{Set}}\gamma y_2)) \in [E_1]^{\operatorname{Rel}}[\alpha := R']$ , i.e.,  $(([E_1]^{\operatorname{Set}}\beta \times [E_2]^{\operatorname{Set}}\beta)(x_1, x_2), ([E_1]^{\operatorname{Set}}\gamma \times [E_2]^{\operatorname{Set}}\gamma)(y_1, y_2)) \in [E_1]^{\operatorname{Rel}}[\alpha := R'] \times [E_2]^{\operatorname{Rel}}[\alpha := R']$ , i.e.,  $([E]^{\operatorname{Set}}\beta x, [E]^{\operatorname{Set}}\beta x, [E]^{\operatorname{Set}}\gamma y) \in [E]^{\operatorname{Rel}}[\alpha := R']$ .
- $E = E_1 + E_2$ . If  $R : \operatorname{Rel}(A,B)$ ,  $R' : \operatorname{Rel}(A',B')$ ,  $(\beta,\gamma) \in \operatorname{Hom}_{\operatorname{Rel}^k}(R,R')$ , and  $(x,y) \in [\![E]\!]^{\operatorname{Rel}}[\alpha := R]$ , then  $x \in [\![E]\!]^{\operatorname{Set}}[\alpha := A] = [\![E_1]\!]^{\operatorname{Set}}[\alpha := A] + [\![E_2]\!]^{\operatorname{Set}}[\alpha := A]$  and  $y \in [\![E]\!]^{\operatorname{Set}}[\alpha := B] = [\![E_1]\!]^{\operatorname{Set}}[\alpha := B] + [\![E_2]\!]^{\operatorname{Set}}[\alpha := B]$ . Since  $(x,y) \in [\![E]\!]^{\operatorname{Rel}}[\alpha := R]$ , we must have either  $x = \operatorname{inl} x_1$  for  $x_1 \in [\![E_1]\!]^{\operatorname{Set}}[\alpha := A]$ ,  $y = \operatorname{inl} y_1$  for  $y_1 \in [\![E_1]\!]^{\operatorname{Set}}[\alpha := B]$ , and  $(x_1,y_1) \in [\![E_1]\!]^{\operatorname{Rel}}[\alpha := R]$ , or  $x = \operatorname{inr} x_2$  for  $x_2 \in [\![E_2]\!]^{\operatorname{Set}}[\alpha := A]$ ,  $y = \operatorname{inr} y_2$  for  $y_2 \in [\![E_2]\!]^{\operatorname{Set}}[\alpha := B]$ , and  $(x_2,y_2) \in [\![E_2]\!]^{\operatorname{Rel}}[\alpha := R]$ . We prove the result for the first case; the second is analogous. By the induction hypothesis,  $(\![\![E_1]\!]^{\operatorname{Set}}\beta x_1, [\![E_1]\!]^{\operatorname{Set}}\gamma y_1) \in [\![E_1]\!]^{\operatorname{Rel}}[\alpha := R']$ , so  $(\operatorname{inl}([\![E_1]\!]^{\operatorname{Set}}\beta x_1)$ ,  $\operatorname{inl}([\![E_1]\!]^{\operatorname{Set}}\gamma y_1)) \in [\![E_1]\!]^{\operatorname{Rel}}[\alpha := R'] + [\![E_2]\!]^{\operatorname{Rel}}[\alpha := R']$ , i.e.,  $([\![\![E]\!]^{\operatorname{Set}}\beta x, [\![\!E]\!]^{\operatorname{Set}}\gamma y) \in [\![\![E]\!]^{\operatorname{Rel}}[\alpha := R']$ .
- $E = \phi^m E_1 ... E_m$ . Suppose  $R : \text{Rel}(A, B), R' : \text{Rel}(A', B'), (\beta, \gamma) \in \text{Hom}_{\text{Rel}^k}(R, R'), R_{\phi} = (R_{\phi}^0, R_{\phi}^1, R_{\phi}^*), \text{ and } R_{\phi}' = (R_{\phi}'^0, R_{\phi}'^1, R_{\phi}'^*).$  If

$$(x,y) \in \llbracket \phi^m E_1 ... E_m \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R}] = R_{\phi}^* (\llbracket E_1 \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R}]) ... (\llbracket E_m \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R}])$$

(since  $\phi \in \alpha$ ), then

$$x \in R_{\phi}^{0}(\llbracket E_{1} \rrbracket]^{\mathsf{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}])...(\llbracket E_{m} \rrbracket]^{\mathsf{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}])$$

and

$$y \in R_{\phi}^{1}(\llbracket E_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}])...(\llbracket E_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}])$$

 Since  $(\boldsymbol{\beta}, \boldsymbol{\gamma}) \in \operatorname{Hom}(R, R')$ , the induction hypothesis gives that, for each  $i = 1, ..., m, (w, z) \in [\![E_i]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R]$  implies  $(\![E_i]\!]^{\operatorname{Set}} \boldsymbol{\beta} w, [\![E_i]\!]^{\operatorname{Set}} \boldsymbol{\gamma} z) \in [\![E_i]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R']$ , i.e.,  $(\![E_i]\!]^{\operatorname{Set}} \boldsymbol{\beta}, [\![E_i]\!]^{\operatorname{Set}} \boldsymbol{\gamma}) \in \operatorname{Hom}_{\operatorname{Rel}}([\![E_i]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R], [\![E_i]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R'])$ . The remark after Definition 10 thus gives that  $(R_\phi^0([\![E_1]\!]^{\operatorname{Rel}}\boldsymbol{\beta})...([\![E_m]\!]^{\operatorname{Set}}\boldsymbol{\gamma})...([\![E_m]\!]^{\operatorname{Set}}\boldsymbol{\gamma})) \in \operatorname{Hom}_{\operatorname{Rel}}(R_\phi^*([\![E_1]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R])...([\![E_m]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R])$ .  $(\![E_m]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R'])$ . Then since  $(x, y) \in R_\phi^*([\![E_1]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R])...([\![E_m]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R])$ .  $(\![E_m]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := R])$ . We have that

$$(R_{\phi}^{0}(\llbracket E_{1} \rrbracket^{\operatorname{Set}} \boldsymbol{\beta})...(\llbracket E_{m} \rrbracket^{\operatorname{Set}} \boldsymbol{\beta})x, R_{\phi}^{1}(\llbracket E_{1} \rrbracket^{\operatorname{Set}} \boldsymbol{\gamma})...(\llbracket E_{m} \rrbracket^{\operatorname{Set}} \boldsymbol{\gamma})y)$$

$$\in R_{\phi}^{*}(\llbracket E_{1} \rrbracket^{\operatorname{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R'}])...(\llbracket E_{m} \rrbracket^{\operatorname{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R'}])$$

$$(11)$$

By hypothesis,  $(\beta_{\phi}, \gamma_{\phi}): R_{\phi}^* \to R_{\phi}'^*$ . Since  $\beta_{\phi}$  and  $\gamma_{\phi}$  are natural transformations, this gives that for all  $S: \operatorname{Rel}(C, D), ((\beta_{\phi})_C, (\gamma_{\phi})_D) \in \operatorname{Hom}_{\operatorname{Rel}}(R_{\phi}^*S, R_{\phi}'^*S)$ . Letting  $S=(\llbracket E_1 \rrbracket^{\operatorname{Rel}}[\alpha:=R']), ..., (\llbracket E_m \rrbracket^{\operatorname{Set}}[\alpha:=R']), ..., (\llbracket E_m \rrbracket^{\operatorname{Set}}[\alpha:=R'])$ , and  $D=(\llbracket E_1 \rrbracket^{\operatorname{Set}}[\alpha:=B']), ..., (\llbracket E_m \rrbracket^{\operatorname{Set}}[\alpha:=B'])$ , and noting that

$$(R_{\phi}^{0}(\llbracket E_{1} \rrbracket^{\mathsf{Set}} \boldsymbol{\beta})...(\llbracket E_{m} \rrbracket^{\mathsf{Set}} \boldsymbol{\beta})x, R_{\phi}^{1}(\llbracket E_{1} \rrbracket^{\mathsf{Set}} \boldsymbol{\gamma})...(\llbracket E_{m} \rrbracket^{\mathsf{Set}} \boldsymbol{\gamma})y) \in R_{\phi}^{*}S$$

by Equation 13, our hypothesis gives that

$$((\beta_{\phi})_{C}(R_{\phi}^{0}(\llbracket E_{1} \rrbracket^{\operatorname{Set}}\boldsymbol{\beta})...(\llbracket E_{m} \rrbracket^{\operatorname{Set}}\boldsymbol{\beta})x), (\gamma_{\phi})_{D}(R_{\phi}^{1}(\llbracket E_{1} \rrbracket^{\operatorname{Set}}\boldsymbol{\gamma})...(\llbracket E_{m} \rrbracket^{\operatorname{Set}}\boldsymbol{\gamma})y))$$

$$\in R_{\phi}^{*}S = R_{\phi}^{*}(\llbracket E_{1} \rrbracket^{\operatorname{Rel}}[\boldsymbol{\alpha} := \boldsymbol{R}'])...(\llbracket E_{m} \rrbracket^{\operatorname{Rel}}[\boldsymbol{\alpha} := \boldsymbol{R}']) = \llbracket E \rrbracket^{\operatorname{Rel}}[\boldsymbol{\alpha} := \boldsymbol{R}']$$

$$(12)$$

Using the definition of the action of  $\llbracket E \rrbracket^{\operatorname{Set}} \boldsymbol{\beta}$  on morphisms (see Diagram 1) twice — once with instantiations  $\rho = A$ ,  $\rho' = A'$ ,  $f = \boldsymbol{\beta}$  and  $\phi \rho = R_{\phi}^0$ , and once with instantiations  $\rho = B$ ,  $\rho' = B'$ ,  $f = \boldsymbol{\gamma}$  and  $\phi \rho = R_{\phi}^1$  — Equation 12 is exactly ( $\llbracket E \rrbracket^{\operatorname{Set}} \boldsymbol{\beta} x$ ,  $\llbracket E \rrbracket^{\operatorname{Set}} \boldsymbol{\gamma} y$ )  $\in \llbracket E \rrbracket^{\operatorname{Rel}} [\boldsymbol{\alpha} := R']$ .

•  $E = (\mu \phi^m.\lambda \delta_1...\delta_m.h)T_1...T_m$ . Suppose  $R : \operatorname{Rel}(A,B), R' : \operatorname{Rel}(A',B'), (\boldsymbol{\beta},\boldsymbol{\gamma}) \in \operatorname{Hom}_{\operatorname{Rel}^k}(R,R')$ , and  $(x,y) \in F^*R = \llbracket E \rrbracket^{\operatorname{Rel}} [\boldsymbol{\alpha} := R]$ . If  $(x,y) \in \llbracket E \rrbracket^{\operatorname{Rel}} [\boldsymbol{\alpha} := R]$ , then  $x \in \llbracket E \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := A]$  and  $y \in \llbracket E \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := B]$ . Consider the relation transformers  $(L^0,L^1,L^*)$  and  $(G^0,G^1,G^*)$ , where

$$\begin{array}{lcl} L^{0} & = & \mu(H \mapsto \lambda X.\llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := A]) \\ L^{1} & = & \mu(H \mapsto \lambda X.\llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := B]) \\ L^{*} & = & \mu(W \mapsto \lambda S.\llbracket h \rrbracket^{\operatorname{Rel}}[\phi := W][\delta := S][\alpha := R]) \\ G^{0} & = & \mu(H \mapsto \lambda X.\llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := A']) \\ G^{1} & = & \mu(H \mapsto \lambda X.\llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := B']) \\ G^{*} & = & \mu(W \mapsto \lambda S.\llbracket h \rrbracket^{\operatorname{Rel}}[\phi := W][\delta := S][\alpha := R']) \end{array}$$

Then  $(x,y) \in L^*(\llbracket T_1 \rrbracket^{\operatorname{Rel}}[\alpha := R])...(\llbracket T_m \rrbracket^{\operatorname{Rel}}[\alpha := R]), \text{i.e., } x \in L^0(\llbracket T_1 \rrbracket^{\operatorname{Set}}[\alpha := A])...(\llbracket T_m \rrbracket^{\operatorname{Rel}}[\alpha := A])$  and  $y \in L^1(\llbracket T_1 \rrbracket^{\operatorname{Set}}[\alpha := B])...(\llbracket T_m \rrbracket^{\operatorname{Rel}}[\alpha := B])$ . Lemma ?? ensures that each i = 1, ...m,  $(\llbracket T_i \rrbracket^{\operatorname{Set}}, \llbracket T_i \rrbracket^{\operatorname{Rel}}, \llbracket T_i \rrbracket^{\operatorname{Rel}}]$  is a relation transformer, so the induction hypothesis gives that  $(w,z) \in \llbracket T_i \rrbracket^{\operatorname{Rel}}[\alpha := R]$  implies  $(\llbracket T_i \rrbracket^{\operatorname{Set}} \boldsymbol{\beta} w, \llbracket T_i \rrbracket^{\operatorname{Set}} \boldsymbol{\gamma} z) \in \llbracket T_i \rrbracket^{\operatorname{Rel}}[\alpha := R']$  for all i = 1, ..., m, i.e.,  $(\llbracket T_i \rrbracket^{\operatorname{Set}} \boldsymbol{\beta}, \llbracket T_i \rrbracket^{\operatorname{Set}} \boldsymbol{\gamma}) \in \operatorname{Hom}_{\operatorname{Rel}}(\llbracket T_i \rrbracket^{\operatorname{Rel}}[\alpha := R], \llbracket T_i \rrbracket^{\operatorname{Rel}}[\alpha := R'])$ . The remark after Definition 10 thus gives that

$$(L^{0}(\llbracket T_{1} \rrbracket^{\mathsf{Set}} \boldsymbol{\beta})...(\llbracket T_{m} \rrbracket^{\mathsf{Set}} \boldsymbol{\beta}), L^{1}(\llbracket T_{1} \rrbracket^{\mathsf{Set}} \boldsymbol{\gamma})...(\llbracket T_{m} \rrbracket^{\mathsf{Set}} \boldsymbol{\gamma})) \\ \in \mathsf{Hom}_{\mathsf{Rel}}(L^{*}(\llbracket T_{1} \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R}])...(\llbracket T_{m} \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R}]), \\ L^{*}(\llbracket T_{1} \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R}'])...(\llbracket T_{m} \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R}']))$$

Then since  $(x,y)\in L^*(\llbracket T_1\rrbracket^{\mathsf{Rel}}[\pmb{\alpha}:=\pmb{R}])...(\llbracket T_m\rrbracket^{\mathsf{Rel}}[\pmb{\alpha}:=\pmb{R}]),$  we have that

$$(L^{0}([\![T_{1}]\!]^{\operatorname{Set}}\boldsymbol{\beta})...([\![T_{m}]\!]^{\operatorname{Set}}\boldsymbol{\beta})x, L^{1}([\![T_{1}]\!]^{\operatorname{Set}}\boldsymbol{\gamma})...([\![T_{m}]\!]^{\operatorname{Set}}\boldsymbol{\gamma})y)$$

$$\in L^{*}([\![T_{1}]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := \boldsymbol{R}'])...([\![T_{m}]\!]^{\operatorname{Rel}}[\boldsymbol{\alpha} := \boldsymbol{R}'])$$
(13)

1:32 Anon.

Now, note that for every functor H and sequence of sets X,

$$\begin{array}{lcl} \eta_{H,X}^0 & = & \llbracket h \rrbracket^{\operatorname{Set}}[\phi := id][\delta := id][\alpha := \beta] \\ & : & \llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := A] \to \llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := A'] \end{array}$$

is a morphism in  $Set^k$ , so

$$\begin{split} \eta^0 &= (H \mapsto \lambda X. \, \llbracket h \rrbracket^{\operatorname{Set}} [\phi := H] [\boldsymbol{\delta} := X] [\boldsymbol{\alpha} := \boldsymbol{\beta}]) \\ &: (H \mapsto \lambda X. \, \llbracket h \rrbracket^{\operatorname{Set}} [\phi := H] [\boldsymbol{\delta} := X] [\boldsymbol{\alpha} := A]) \\ &\to (H \mapsto \lambda X. \, \llbracket h \rrbracket^{\operatorname{Set}} [\phi := H] [\boldsymbol{\delta} := X] [\boldsymbol{\alpha} := A']) \end{split}$$

is a morphism (i.e., a higher-order natural transformation) between higher-order functors between functors on  $\mathsf{Set}^m \to \mathsf{Set}$ : indeed, for every natural transformation  $f: H \to H'$  we have that

commutes because the vertical arrows are the A and A' components of the natural transformation  $[\![h]\!]^{\operatorname{Set}}[\phi:=f][\delta:=id_X][\alpha:=id_{-}]$  induced by f between the functors  $[\![h]\!]^{\operatorname{Set}}[\phi:=H][\delta:=X][\alpha:=]$  and  $[\![h]\!]^{\operatorname{Set}}[\phi:=H'][\delta:=X][\alpha:=]$ . Similarly, if

$$\begin{array}{lll} \eta^1_{H,X} & = & \llbracket h \rrbracket^{\operatorname{Set}}[\phi := id][\delta := id][\alpha := \gamma] \\ & : & \llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := B] \to \llbracket h \rrbracket^{\operatorname{Set}}[\phi := H][\delta := X][\alpha := B'] \end{array}$$

and

$$\begin{split} \eta^1 &= (H \mapsto \lambda X. \, \llbracket h \rrbracket^{\operatorname{Set}} [\phi := H] [\delta := X] [\alpha := \gamma]) \\ &: (H \mapsto \lambda X. \, \llbracket h \rrbracket^{\operatorname{Set}} [\phi := H] [\delta := X] [\alpha := B]) \\ &\to (H \mapsto \lambda X. \, \llbracket h \rrbracket^{\operatorname{Set}} [\phi := H] [\delta := X] [\alpha := B']) \end{split}$$

then  $\eta^1$  is a morphism between higher-order functors between functors on  $Set^m \to Set$ . Since  $\mu$  is functorial, it has an action on morphisms, so  $\mu\eta^0: L^0 \to G^0$  and  $\mu\eta^1: L^1 \to G^1$  are well-defined. Moreover, since  $(\beta, \gamma) \in Hom_{Rel}(R, R')$ , the following diagram commutes:

$$L^{0}(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}']) \xrightarrow{(\mu\eta^{0})(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}'])} G^{0}(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}'])$$

$$L^{*}(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{R}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{R}']) G^{*}(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{R}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{R}'])$$

$$L^{1}(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{B}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{B}']) \xrightarrow{(\mu\eta^{1})(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{A}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{B}'])} G^{1}(\llbracket T_{1} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{B}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{B}']) (15)$$

1614

```
Together with Equation 13, Equation 15 gives
1570
                                   ((\mu \eta^{0})([T_{1}])^{\operatorname{Set}}[\boldsymbol{\alpha} := A'])...([T_{m}])^{\operatorname{Set}}[\boldsymbol{\alpha} := A'])(L^{0}([T_{1}])^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{\beta}])...([T_{m}])^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{\beta}])x),
                                       (\mu \eta^{1})([T_{1}]^{\operatorname{Set}}[\alpha := A'])...([T_{m}]^{\operatorname{Set}}[\alpha := A'])(L^{1}([T_{1}]^{\operatorname{Set}}[\alpha := \nu])...([T_{m}]^{\operatorname{Set}}[\alpha := \nu])\nu))
                                                    \in G^*(\llbracket T_1 \rrbracket^{\mathsf{Rel}} \llbracket \boldsymbol{\alpha} := \boldsymbol{R'} \rrbracket)...(\llbracket T_m \rrbracket^{\mathsf{Set}} \llbracket \boldsymbol{\alpha} := \boldsymbol{R'} \rrbracket)
                                                  = \llbracket (\mu \phi. \lambda \delta. h) T \rrbracket^{\text{Rel}} \llbracket \alpha := R' \rrbracket
                                                   = \llbracket E \rrbracket^{\text{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R'}]
                                                                                                                                                                                                                                                                                                                               (16)
                                       We also have that if \psi is a fresh type constructor variable, then
                                                        [\![\psi T_1...T_m]\!]^{\mathrm{Set}}[\alpha := A][\psi := L^0] = L^0([\![T_1]\!]^{\mathrm{Set}}[\alpha := A])...([\![T_m]\!]^{\mathrm{Set}}[\alpha := A])
                                       and
1580
                                                   [\![\psi T_1...T_m]\!]^{\text{Set}}[\alpha := A'][\psi := G^0] = G^0([\![T_1]\!]^{\text{Set}}[\alpha := A'])...([\![T_m]\!]^{\text{Set}}[\alpha := A'])
1581
1582
                                       so that
1583
                                                 \llbracket \psi T_1 ... T_m \rrbracket^{\text{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}] [\psi := \mu \eta^0]
1584
                                     = (\mu \eta^0)(\llbracket T_1 \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{A}'])...(\llbracket T_m \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{A}']) \circ L^0(\llbracket T_1 \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}])...(\llbracket T_m \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}])
1585
                                              L^{0}(\llbracket T_{1} \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{A}])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{A}]) \to G^{0}(\llbracket T_{1} \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{A}'])...(\llbracket T_{m} \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{A}'])(17)
1587
                                       Similarly.
1588
1589
                                                  \llbracket \psi T_1 ... T_m \rrbracket^{\text{Set}} [\boldsymbol{\alpha} := \boldsymbol{\gamma}] [\psi := \mu \eta^1]
1590
                                     = (\mu \eta^{1})([\![T_{1}]\!]^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{B'}])...([\![T_{m}]\!]^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{B'}]) \circ L^{1}([\![T_{1}]\!]^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{\gamma}])...([\![T_{m}]\!]^{\operatorname{Set}}[\boldsymbol{\alpha} := \boldsymbol{\gamma}])
1591
                                       : \quad L^1(\llbracket T_1 \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{B}])...(\llbracket T_m \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{B}]) \to G^1(\llbracket T_1 \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{B}'])...(\llbracket T_m \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{B}'])(18)
1592
1593
                                       Rewriting Equation 16 using Equations 17 and 18 gives
1594
                           (\llbracket \psi T_1 ... T_m \rrbracket^{\mathsf{Set}} \llbracket \boldsymbol{\alpha} := \boldsymbol{\beta} \rrbracket \llbracket \psi := \mu \eta^0 \rrbracket \boldsymbol{x}, \llbracket \psi T_1 ... T_m \rrbracket^{\mathsf{Set}} \llbracket \boldsymbol{\alpha} := \boldsymbol{\nu} \rrbracket \llbracket \psi := \mu \eta^1 \rrbracket \boldsymbol{u}) \in \llbracket \boldsymbol{E} \rrbracket^{\mathsf{Rel}} \llbracket \boldsymbol{\alpha} := \boldsymbol{R'} \rrbracket
1595
                                       Now we have that
1596
1597
                                                        \llbracket \psi T_1 ... T_m \rrbracket^{\text{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}] [\psi := \mu \eta^0]
1598
                                                      \mu \eta^0(\llbracket T_1 \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}])...(\llbracket T_m \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}])
1599
                                           = \mu(H \mapsto \lambda X. \llbracket h \rrbracket^{\mathsf{Set}} [\phi := H] [\boldsymbol{\delta} := X] [\boldsymbol{\alpha} := \boldsymbol{\beta}]) (\llbracket T_1 \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}]) ... (\llbracket T_m \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}])
1600
1601
                                           = \llbracket (\mu \phi. \lambda \delta. h) T_1 ... T_m \rrbracket^{\text{Set}} [\alpha := \beta]
1602
                                       and
1603
                                                        \llbracket \psi T_1 ... T_m \rrbracket^{\text{Set}} [\boldsymbol{\alpha} := \boldsymbol{\gamma}] [\psi := \mu \eta^1]
1604
1605
                                           = \mu \eta^{1}(\llbracket T_{1} \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{\gamma}])...(\llbracket T_{m} \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{\gamma}])
1606
                                                      \mu(H \mapsto \lambda X. \llbracket h \rrbracket^{\operatorname{Set}} [\phi := H] [\boldsymbol{\delta} := X] [\boldsymbol{\alpha} := \boldsymbol{\gamma}]) (\llbracket T_1 \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{\gamma}]) ... (\llbracket T_m \rrbracket^{\operatorname{Set}} [\boldsymbol{\alpha} := \boldsymbol{\gamma}])
1607
                                           = \|[(\mu\phi.\lambda\boldsymbol{\delta}.h)T_1...T_m]\|^{\text{Set}}[\boldsymbol{\alpha}:=\boldsymbol{\gamma}]
1608
1609
                                       so (19) becomes
1610
                                  (\llbracket (\mu\phi.\lambda\boldsymbol{\delta}.h)T_1...T_m \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{\beta}]x, \llbracket (\mu\phi.\lambda\boldsymbol{\delta}.h)T_1...T_m \rrbracket^{\mathsf{Set}} [\boldsymbol{\alpha} := \boldsymbol{\gamma}]y) \in \llbracket E \rrbracket^{\mathsf{Rel}} [\boldsymbol{\alpha} := \boldsymbol{R'}]
                                                                                                                                                                                                                                                                                                                               (20)
1611
1612
                                       i.e., ([E]^{Set} \beta x, [E]^{Set} \gamma y) \in [E]^{Rel} [\alpha := R'].
```

With the following standard definition, we can prove that our interpretations give rise to a Graph Lemma.

1:34 Anon.

Definition 37. If  $f: A \to B$  then the relation  $\langle f \rangle$ : Rel(A, B) is defined by  $(x, y) \in \langle f \rangle$  iff fx = y.

Note that  $\langle id_B \rangle = \text{Eq}_B$ .

THEOREM 38. If  $f_i: A_i \to B_i$  for i = 1, ..., k then  $F^*\langle f \rangle_1 ... \langle f \rangle_k = \langle F f_1 ... f_k \rangle$ .

PROOF. First observe that

$$((f_1,...,f_k),(id_{B_1},...,id_{B_k})) \in \operatorname{Hom}_{\operatorname{Rel}^k}(\langle f \rangle,\operatorname{Eq}_{B_k})$$

and

$$((id_{A_1},...,id_{A_k}),(f_1,...,f_k)) \in \mathsf{Hom}_{\mathsf{Rel}^k}(\mathbf{Eq}_{A_i},\langle f \rangle)$$

Applying Proposition 36 to each of these observations gives that

$$(Ff, Fid_{B_i}) \in \operatorname{Hom}_{\operatorname{Rel}}(F^*\langle f \rangle, F^*\mathbf{Eq}_{B_i})$$
 (21)

and

$$(Fid_{A_i}, Ff) \in \text{Hom}_{\text{Rel}}(F^* \mathbf{Eq}_{A_i}, F^* \langle f \rangle)$$
(22)

Expanding Equation 21 gives that if  $(x, y) \in F^* \langle f \rangle$  then  $(Ffx, Fid_{B_i}y) \in F^* \mathbf{Eq}_{B_i} = [\![E]\!]^{\mathrm{Rel}}[\alpha := \mathbf{Eq}_{B_i}] = \mathrm{Eq}_{FB}$ , where the penultimate equality holds by Theorem 25. That is, if  $(x, y) \in F^* \langle f \rangle$  then  $(Ffx, y) \in \mathrm{Eq}_{FB}$ , i.e., if  $(x, y) \in F^* \langle f \rangle$  then  $(x, y) \in F^* \langle f \rangle$  then  $(x, y) \in F^* \langle f \rangle$ .

Similar analysis of Equation 22 gives that  $\langle Ff \rangle \subseteq F^* \langle f \rangle$ .

Inlining the definitions of F and  $F^*$  in the statement of Theorem 38 gives

$$\llbracket E \rrbracket^{\text{Rel}} [\alpha := \langle f \rangle] = \langle \llbracket E \rrbracket^{\text{Set}} [\alpha := f] \rangle \tag{23}$$

We can use Equation 23 to prove that the set interpretation of a closed term of (closed) type  $\operatorname{Nat}^{\alpha} FG$  is a natural transformation.

Theorem 39. If  $\vdash t : \operatorname{Nat}^{\alpha} FG$  and  $f : A \to B$ , then  $[\![t]\!]_B^{\operatorname{Set}} \circ [\![F]\!]^{\operatorname{Set}}[\alpha := f] = [\![G]\!]^{\operatorname{Set}}[\alpha := f] \circ [\![t]\!]_A^{\operatorname{Set}}$ .

PROOF. Theorem 31 ensures that  $(\llbracket t \rrbracket)^{\operatorname{Set}}, \llbracket t \rrbracket)^{\operatorname{Set}} \in \llbracket \operatorname{Nat}^{\alpha} F G \rrbracket^{\operatorname{Rel}}, \text{ i.e., that for all } R : \operatorname{Rel}(A, B), x : FA, \text{ and } x' : FB, \text{ if } (x, x') \in \llbracket F \rrbracket^{\operatorname{Rel}}[\alpha := R] \text{ then } (\llbracket t \rrbracket)^{\operatorname{Set}}_A x, \llbracket t \rrbracket)^{\operatorname{Set}}_B x') \in \llbracket G \rrbracket^{\operatorname{Rel}}[\alpha := R]. \text{ If } f : A \to B, \text{ then taking } R = \langle f \rangle \text{ and instantiating gives that if } (x, x') \in \llbracket F \rrbracket^{\operatorname{Rel}}[\alpha := \langle f \rangle] \text{ then } (\llbracket t \rrbracket)^{\operatorname{Set}}_A x, \llbracket t \rrbracket)^{\operatorname{Set}}_B x') \in \llbracket G \rrbracket^{\operatorname{Rel}}[\alpha := \langle f \rangle]. \text{ By Equation 23 this is the same as the requirement that if } (x, x') \in \langle \llbracket F \rrbracket^{\operatorname{Set}}[\alpha := f] \rangle \text{ then } (\llbracket t \rrbracket)^{\operatorname{Set}}_A x, \llbracket t \rrbracket)^{\operatorname{Set}}_B x') \in \langle \llbracket G \rrbracket^{\operatorname{Set}}[\alpha := f] \rangle \text{ i.e., that if } x' = \llbracket F \rrbracket^{\operatorname{Set}}[\alpha := f] x \text{ then } \llbracket t \rrbracket)^{\operatorname{Set}}_B x' = \llbracket G \rrbracket^{\operatorname{Set}}[\alpha := f] (\llbracket t \rrbracket)^{\operatorname{Set}}_A x, \text{ i.e., that } \llbracket t \rrbracket)^{\operatorname{Set}}_B x' = \llbracket G \rrbracket^{\operatorname{Set}}[\alpha := f] x \text{ i.e., that } \mathbb{I}_B x' = \mathbb{I}_B x' =$
